There are a number of proposed fossil fuel projects scheduled for New Jersey, that include fracked natural gas compressor stations, pipelines and power plants, which do not support a clean energy future, and only continues our reliance on fossil fuels. Regulatory changes are needed to deny approval of new oil and gas projects that conflict with the State's goal to reduce emissions.

Recent legislature enacted requires 50% renewable energy by 2030. New Jersey should be a clean energy leader, and EMP can put the State on a direct path to a future of 100% clean energy. This is what New Jersey residents want.
