The New Jersey Department of Environmental Protection and the New Jersey Department of Health can provide more information on the advisories and the health effects of chemical contaminants in the fish. To stay current with advisory updates and to request additional information, please contact the NJDEP, Division of Science and Research at 1-609-940-4080 or check the website https://www.FishSmartEatSmartNJ.org or the NJDOH at (609) 826-4935.

Introduction

This 2020 update uses the results of a study involving the analysis of samples of fish species collected from lakes, rivers, ponds and reservoirs that flow within the Upper Delaware River and Passaic River regions. This information was used to support the continuation and revision of the current fish consumption advisories for this region and identified the need for additional fish consumption advisories.

This booklet summarizes the marine, estuarine and freshwater fish consumption advisories for New Jersey. It provides you with information on how to reduce your risk by avoiding or limiting consumption of certain fish. It also offers guidance in how to prepare the fish you eat from local waters in ways that reduce your exposure to PCBs, dioxins and other contaminants.

Fishing provides enjoyable and relaxing recreation. Many people enjoy cooking and eating their own catch. Fish are an excellent source of protein, minerals and vitamins, are low in fat and cholesterol and play an important role in maintaining a healthy, well-balanced diet. The American Heart Association recommends people eat fish regularly. Fish are also one of the few foods that are rich in the omega-3 fatty acids needed for proper development of the brain and nervous system in the fetus and infants and may reduce the risk of heart attack. Fish are an excellent substitute for other protein foods that are higher in saturated fats and cholesterol. Health professionals recommend that you include fish in your diet.

However, certain fish may contain contaminants, such as polychlorinated biphenyls (PCBs), dioxins, mercury, and other contaminants from the water they live in and the food they eat. Contaminants such as dioxin and PCBs are classified by the U.S. Environmental Protection Agency as probable cancer-causing substances in humans. Elevated levels of mercury can pose health risks to the human nervous system, particularly to developing fetuses. Therefore, it is a good idea to follow a few precautions in consuming recreationally caught fish and crabs, particularly if you eat them often.

Since 1982, when research began to show elevated levels of potentially harmful contaminants in certain fish and crabs in some New Jersey waters, fish consumption advisories were adopted to guide citizens on safe consumption practices. Fish consumption advisories are developed through a scientific process that includes collecting samples of fish from waters throughout the state and analyzing them for various chemical contaminants. The contaminant levels in the fish are then evaluated using state and federal guidelines for protecting human health.

The New Jersey Department of Environmental Protection (NJDEP) and Department of Health (NJDOH) provide advice on consuming those species of fish in which high levels of chemical contaminants have been found. Since levels of contaminants may vary from one location to another and from one fish species to another, the advisories are also separated by site. **So be sure to check which guidelines refer to your fishing location and the fish species you catch.**

2020 Fish Consumption Advisories for PCBs, Dioxin and Mercury

The advisory table in this booklet provides statewide, regional, and water body-specific advisory information for various fish species. The table lists the recommended fish consumption frequencies for the **General Population** and **High-risk Individuals** for waters statewide and for specific water bodies.

High Risk Individuals: Includes infants, children, pregnant women, nursing mothers and women of childbearing age.

General Population: Includes all others not in the high-risk category.

All fish consumption advisories are presented in meal frequencies (for example: one meal per month or four meals per year). For PCB advisories this range is based on an estimated 1 in 10,000 risk of cancer during your lifetime from eating fish at the advisory level. This means that one additional cancer may occur in 10,000 people eating fish at the advisory level for a lifetime.

By using this advisory, you have the necessary information to make an informed choice on the number of meals of fish to consume. You can reduce your risk further by eating less than the advisory meal frequency, however, this need to be balanced with the health benefits of eating fish.

The limits that follow each species assume that no other contaminated fish are being eaten. If you eat more than one species of fish listed in the advisory, the total consumption of fish should not exceed the recommended frequency as a guideline for consumption. The best approach is to use the lowest recommended frequency as a guideline for consumption. **Example: If you fish Union Lake, and you are in the general population category, you can eat four meals of white perch or you can eat one meal of Largemouth Bass over the course of a month, but not both.**

If your specific fishing location is not mentioned within the advisories on the following pages, this does not mean the fish are free of contamination. Not all New Jersey waters or fish species have been tested, and not all fish species were found in all locations, or in some cases available data were insufficient to list a species for a specific water body. **Follow the statewide advisory for the listed species if your fishing area is not mentioned in the guidelines or follow the statewide advisory of one meal per week for (general Population) or one meal per month (high-risk individuals) for freshwaters.**

General Consumption Guidelines

Fish Species: Contaminant levels may vary from species to species. If possible, eat smaller amounts of several different types of fish rather than a large amount of one type that may be high in contaminants. Try to focus your consumption on those species of fish that have lower levels of contaminants, such as fluke or flounder.

Fish Size: Smaller fish of a species will usually have lower chemical levels than larger fish in the same location because contaminants tend to build up in the fish over time. It is advisable to eat smaller fish (of legal size) more often than larger fish.

High-risk Individuals: Infants, children, pregnant women, nursing mothers and women of childbearing age are considered to be at higher risk from contaminants in fish than members of the general public. People within this category should be particularly careful about following the advisories, because of the greater potential for PCBs, dioxin and mercury to affect the development of the fetus, infant, and young child.

Subsistence Fishing: Avoid subsistence level (relying on wild caught fish for daily nutritional needs) fishing activities in large rivers within or immediately downstream of large urban/ industrial areas and wastewater outfalls. Fish in these areas are more likely to contain traces of chemical contaminants.

Health Effects from Consumption of Contaminated Fish and Crabs (General Advice)

Exposure to low levels of some contaminants in the environment may have long lasting health effects on people. Mercury, PCBs and dioxins are among the major contaminants found in some New Jersey fish in portions of the state. These contaminants can be especially harmful to women of childbearing age, pregnant women and nursing mothers. Trace amounts of these contaminants may remain in your body for a period of time after eating. Should you become pregnant during this time, these contaminants can be passed along to your fetus, potentially affecting the development of the nervous system. Children are also at risk of developmental and neurological problems if exposed to these chemicals.

Mercury

Mercury is a toxic metal that has been commonly used in a number of products (e.g., thermometers, electrical switches). There are many sources of mercury in the environment, natural and man-made; primary sources include burning of fossil fuels such as coal, incineration of wastes, and metal processing/ manufacturing.

NJ has taken aggressive action to reduce sources of mercury in the state. Levels of mercury from in-state air sources have been reduced by over 90% since the 1990s. Current sources of mercury to NJ are primarily from global as well as other states' air emissions (e.g., coal power plants) and natural emissions.

Mercury discharged to the environment can end up in local water bodies. Mercury accumulates in fish muscle tissue through the aquatic food chain from the food that fish eat. Above certain levels, mercury can damage the nervous system, particularly in unborn and young children, resulting in learning and developmental delays. Regular consumption, of even low amounts of mercury may cause subtle effects on the central nervous system in both children and adults. In addition, long-term consumption of fish with elevated levels of mercury by adults and older children may result in adverse health effects, including neurological damage. For more information go to: www.epa.gov/mercury.

PCBs

PCBs Polychlorinated biphenyls (PCBs) were commercially produced for industrial application in heat transfer systems, hydraulic fluids and electrical equipment. They were later incorporated into other uses such as printing inks, paints and pesticides. The manufacture of PCBs was stopped in 1979 as a result of evidence that PCBs build up in the environment and cause harmful effects. PCBs tend to stay mostly in soil and sediment but are also found in the air and water.

Once they enter the food chain, they have a tendency to absorb into fat tissue. PCBs build up in fish to levels that are hundreds of thousands of times higher than the levels in the surrounding water. When people consume fish that have already accumulated PCBs, the PCBs then accumulate in their bodies.

PCBs have been shown to cause cancer in animals, and there is evidence that PCBs may cause cancer in exposed humans. PCBs have also been shown to cause a number of serious health effects besides cancer in humans and animals, including effects on the nervous system of the developing fetus, the immune system,

and the reproductive system. Studies have shown that unborn and young children are most at risk to PCB exposure. Because PCBs take a long time to leave the body after they accumulate, women who plan to become pregnant should follow the more restrictive consumption advice before becoming pregnant. For more information go to: https://www.epa.gov/pcbs/learn-about-polychlorinated-biphenyls-pcbs

Dioxin

Dioxin is the most toxic member of a large chemical family of related dioxins and furans. Dioxin is an unwanted industrial byproduct formed through numerous processes, including production of chlorinated phenol products such as herbicides, the incineration of municipal solid waste, and creation of paper products using bleach. Most of what we know about dioxin has been obtained through animal toxicity testing in the laboratory and representative wildlife species. Dioxin produces a number of effects in animal testing, including suppression of the immune system, impaired reproduction, birth defects in some species tested, a skin condition called chloracne, alterations in liver function, and cancer. The federal Environmental Protection Agency (EPA) has classified dioxin as a probable human carcinogen. For more information go to: https://www.epa.gov/choose-fish-and-shellfish-wisely/should-i-be-concerned-about-eating-fish-and-shellfish

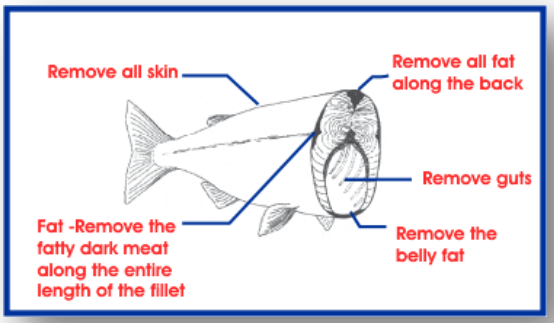
PFOS

PFOS (perfluorooctane sulfonate) is a member of a larger group of chemicals known as PFAS (per- and polyfluoroalkyl substances). PFOS has been used in a variety of consumer products and industrial applications including water/stain resistant clothing, and aqueous film-forming foams employed in firefighting primarily at military bases and civilian airports. PFOS that is released into the environment can contaminate surface water as well as groundwater used as drinking water sources. PFOS that enters surface waters can accumulate in freshwater fish. Consumption of fish from contaminated waters can lead to exposure to PFOS at levels that may cause health concerns. Studies in human populations exposed to PFOS have identified a number of health effects that are associated with PFOS. The most sensitive of these effects involve effects on the immune system, including decreased vaccine response and increased incidence of childhood infections that are associated with maternal exposure during pregnancy. Studies have also identified increased serum uric acid/hyperuricemia as well as increased total cholesterol. Animal studies have also shown that the immune system is very sensitive to PFOS which causes decreased response to foreign substances. In addition, animal studies have also identified effects of PFOS on the liver and thyroid hormones. Developmental effects have also been observed in the offspring of pregnant animals exposed to PFOS.

Because PFOS can cross the placenta, consumption of PFOS contaminated fish by pregnant women and women of childbearing age places them in a high-risk population category for fish consumption advisories. The health effects from other PFAS may differ somewhat from those for PFOS, but all have the ability to cross the placenta, and therefore, also place pregnant women and women of childbearing age in the high-risk population category.

Preparation and Cooking Methods for Fish and Crabs under Advisory

The best way to reduce exposure to contaminants in fish is to learn what fish species are affected and either limit or avoid consumption. However, if you must eat those species under advisories, there are steps you can take to reduce your exposure. Contaminants tend to concentrate in the fatty tissue of the fish you catch. Proper cleaning and cooking techniques, which remove some of the fat from the fish, can significantly reduce levels of PCBs, dioxins and other organic chemicals. Please note, however, that these techniques will not reduce or remove unsafe levels of mercury from these fish. Mercury occurs in the flesh. There is no way to remove mercury through cooking. The best way to reduce mercury exposure is to select those species of fish which are known to have lower levels of mercury.

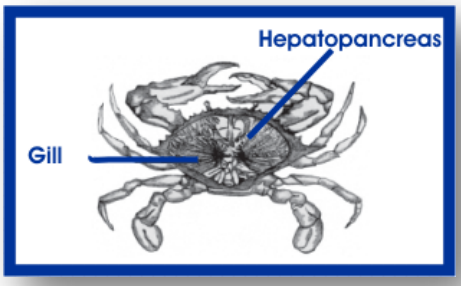


Fish Preparation Methods

Proper fish cleaning and cooking techniques may reduce PCB levels by approximately 50 percent when compared to raw fish fillets. A meal size is considered to be an uncooked 8-ounce fillet. **Eat only the fillet portions**. Do not eat whole fish or steak portions. Many chemical contaminants, like PCBs and pesticides (but not mercury), are stored in the fatty portions of fish. To reduce the levels of these chemicals, skin the fish and trim any of the dark meat (lateral line), back strap and belly flap. The following diagram illustrates those body portions. Do not eat the heads, guts or liver, because PCBs usually concentrate in those body parts. Also, avoid consumption of any reproductive parts such as eggs (roe).

Fish Cooking Methods

Use a cooking method such as baking, broiling, frying, grilling, or steaming that allows the fats and juices to drain away from the fish. When possible, cook the fish on an elevated rack that allows fats and juices to drain to the pan below. Avoid batter, breading or coatings that can hold in the juices that may contain contaminants. The juices should be thrown away since they contain the PCBs and other chemicals that were in the fat. Do not pour these juices over the fish as a sauce or to moisten the fish. Butter, margarine or other liquids can be added to the fish for this purpose once the juices have been poured off. After cooking, discard all liquids and frying oils. Do not reuse. Do not use heads, skin, trimmed fatty portions in soups, stews, chowders, boils, broth or for fish stock. If you make stews or chowders, only use skinless fillet parts. Raw fish may be infested by parasites. Cook fish thoroughly to destroy the parasites. This also helps to reduce the level of many chemical contaminants.



Crab Preparation Methods

Eating, selling or taking (harvesting) blue crabs from Newark Bay Complex and the tidal Passaic River is prohibited. The Newark Bay Complex is located in northeastern New Jersey. It includes the Newark Bay, tidal Hackensack River, Arthur Kill, Kill Van Kull and tidal tributaries. (See chart on page 6.) If blue crabs are taken from water bodies other than the Passaic River/

Newark Bay Complex, the following preparation techniques can be followed to reduce exposure to some contaminants.

The highest levels of chemical contaminants are found in the hepatopancreas, commonly known as the tomalley or green gland. It is the yellowish green gland under the gills. This material is found next to the lump meat (backfin) portion of the crab. Chill and break the crabs immediately before cooking. Care must be taken to remove all of the hepatopancreas before cooking.

There is no specific cooking method available to reduce the chemical contaminant levels in blue crabs. The following steps for proper preparation are key to reducing your exposure to harmful chemical contaminants.

Do not eat the green gland (hepatopancreas). Remove green gland (hepatopancreas) before cooking. After cooking, discard the cooking water. Do not use cooking water or green gland (hepatopancreas) in any juices, sauces, bisques or soups.

See brochures on the FishSmartEatSmartnj.org website for instructions on ways to properly clean and cook fish and crabs.
Crab (English) (Spanish)
Carp (English) (Polish)
Catfish(English)

Federal Advice on Fish Consumption for Pregnant Women and Children

The following is provided as general information and advice from the federal government. Do not eat Shark, Swordfish, King Mackerel, Marlin, Orange Roughy, Bigeye Tuna or Tilefish (Gulf of Mexico) because they contain high levels of mercury. Note: No advisory for Tilefish harvested from the mid-Atlantic and southern New England area. See https://www.fda.gov/food/consumers/advice-about-eating-fish for detailed information.

What Pregnant Women & Parents Should Know

Fish and other protein-rich foods have nutrients that can help your child's growth and development. For women of childbearing age (about 16-49 years old), especially pregnant and breastfeeding women, and for parents and caregivers of young children.

Additional information on contaminants in New Jersey's fish, see fishsmarteatsmart.org.

For more information on EPA freshwater fish consumption advisories, go to https://www.epa.gov/fish-tech

2020 New Jersey Fish Consumption Advisories

Statewide Estuarine and Marine Waters

(Applies to all coastal waters and includes the water way specific advisories)

Species	General Population [2,3]	High Risk Population [1,2,3]
Striped Bass*	One meal per month	Do not eat
American Eel	Four meals per year	Do not eat
Bluefish (greater than 6lbs./ 24 inches)	Six meals per year	Do not eat
Bluefish (less than 6 lbs./ 24 inches)	One meal per month	Do not eat
American Lobster	Do not eat the green gland (tomalley or hepatopancreas)	Do not eat the green gland (tomalley or hepatopancreas)

2020 New Jersey Fish Consumption Advisories

Statewide Freshwater

(Applies to all waters except Pinelands region and includes the waterbody specific advisories)

Species	General Population [2,3]	High Risk Population [1,2,3]
Trout (Brown, Brook, Rainbow, and Hybrid Species)	One meal per week	One meal per week
Largemouth Bass	One meal per week	One meal per month
Smallmouth Bass	One meal per week	One meal per month
Chain Pickerel	One meal per week	One meal per month
Sunfish[4]	No restrictions	One meal per week
Brown Bullhead	No restrictions	One meal per month
Yellow Bullhead	No restrictions	One meal per month
Common Carp	One meal per month	Do not eat

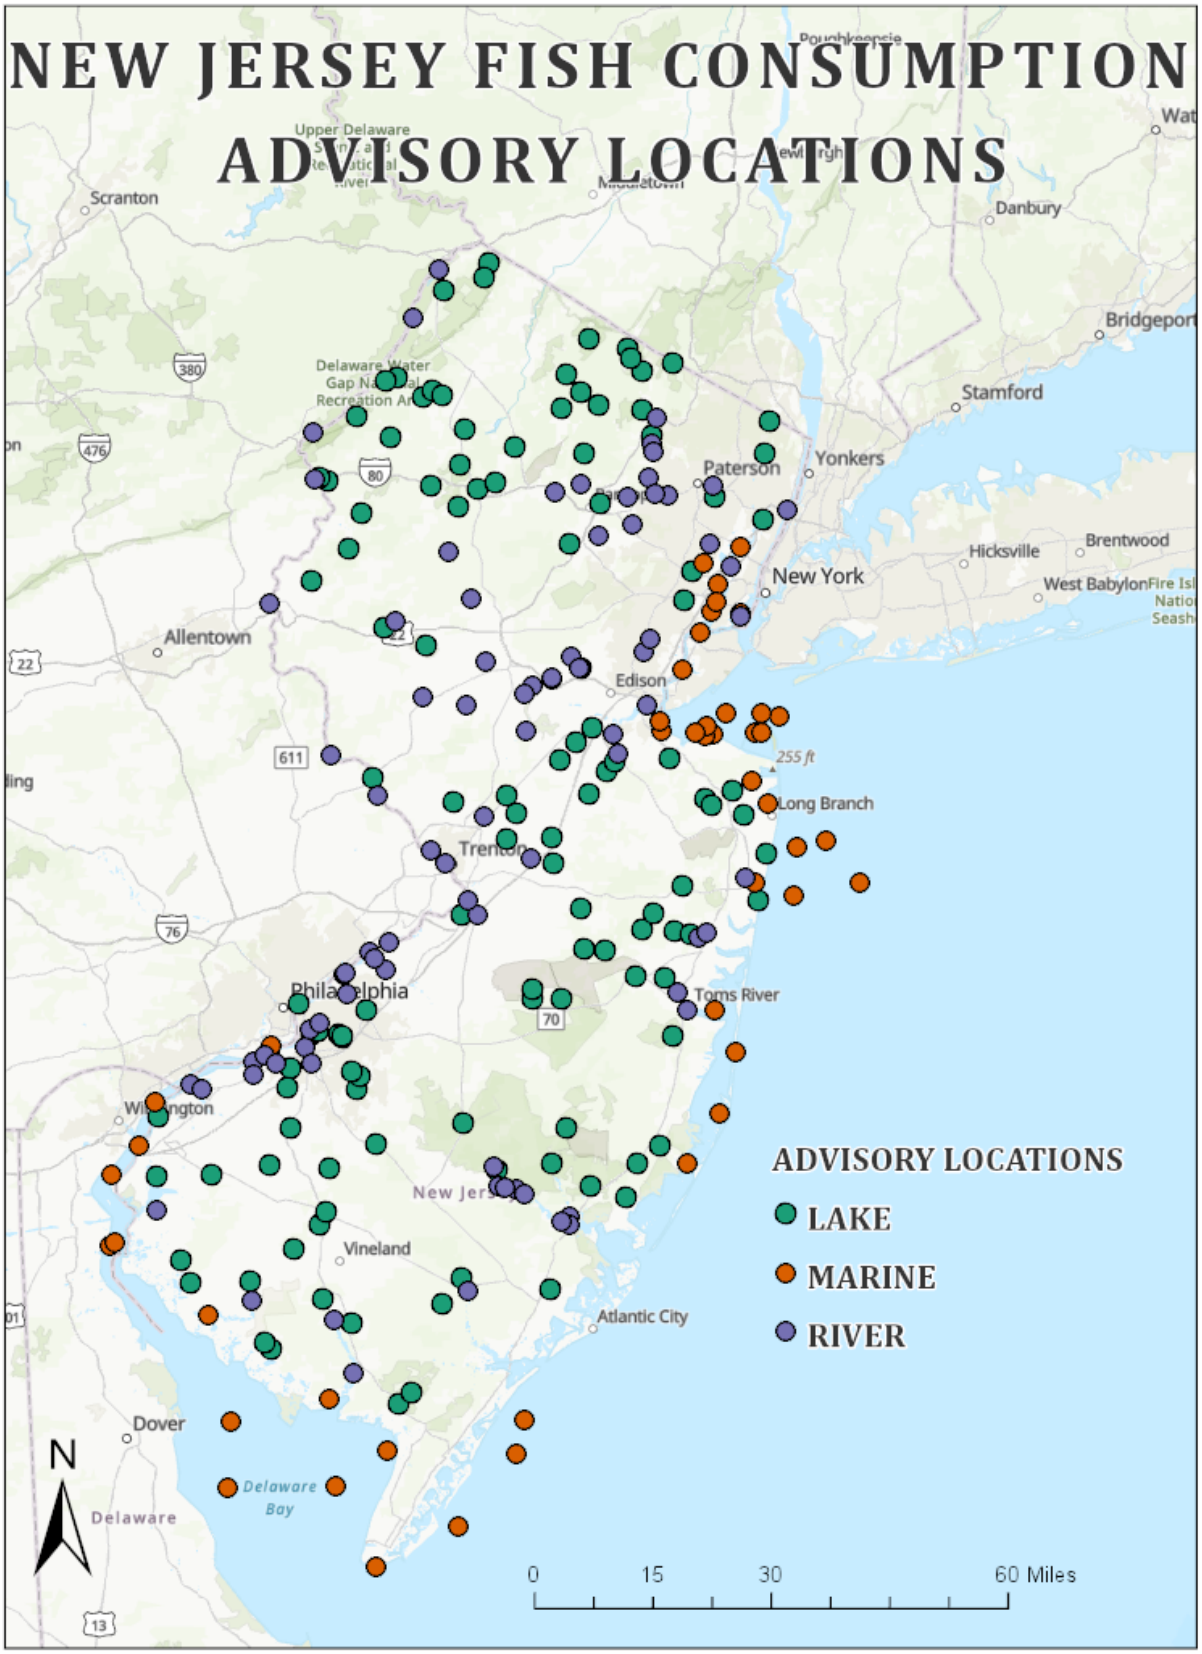
2020 New Jersey Fish Consumption Advisories

Pinelands Region

(Applies to all Pinelands waters including the waterbody specific advisories)

Species	General Population [2,3]	High Risk Population [1,2,3]
Largemouth Bass	One meal per month	Do not eat
Smallmouth Bass	One meal per week	One meal per month
Chain Pickerel	One meal per month	Do not eat
Sunfish[4]	No restrictions	One meal per month
Brown Bullhead	One meal per week	Do not eat
Yellow Bullhead	One meal per week	Do not eat
Common Carp	One meal per week	One meal per month

[1]High-Risk Individuals include infants, children, pregnant women, nursing mothers and women of childbearing age.
[2]One meal is defined as an eight-ounce serving.
[3]Eat only the fillet portions of the fish. Use proper trimming techniques to remove fat, and cooking methods that allow juices to drain from the fish (e.g., baking, broiling, frying, grilling, and steaming). See text for full description.
[4]Sunfish includes bluegill, pumpkinseed, and redbreast sunfish species.
[5]No harvest means no taking or attempting to take any blue crabs from these waters.
[6]Do not eat the hepatopancreas, discard cooking liquid
*Selling these species for human consumption from designated New Jersey waters is prohibited.
Note: Not all fish species available were collected and/or analyzed from all waterways.



For specific site locations, please see our [online story map]

Freshwater Waterbody Specific Advisories

Atlantic County	
Atlantic City Reservoir at Pomona	Lake
Great Egg Harbor	River
