	Summary of Changes
June 29, 1999 Version 1.0	 Initial Release. Changes since last draft: Changed "EGS" to "ESP" and "EDC" to "LDC" throughout the guideline. Removed "NJ Definitions" and replaced it with "LDC Definitions" and "ESP Definitions" in the Notes section. Added "How to use the implementation guideline" page. In addition, changed all headers to the true X12 definition. Also corrected the Table on Page 4 to reflect X12 definitions and added the words "X12 Structure" to the title on that page.
July 1, 1999 Version 1.1	 Removed Code 77 from the BPT07 and modified code F to indicate that it is used when the customer account finals in addition to if the customer switched to a new ESP. Clarified that Document Due Date is not provided for cancel transaction. Added "Must Use" to MEA07 per the data dictionary. Added " if the LDC reads the meter" to the requirements for the PTD*BB Loop.
October 1, 1999 Version 1.1a	 Add Delaware Use for Delmarva Add BPT04 code to indicate this is for Summary Data only for an Interval customer. Added clarification to use of DTM*649 to indicate it should only be used for Bill Ready. It is not valid for Rate Ready or Dual Billing.
November 4, 1999 Version 1.2	This is a FINAL version for Pennsylvania and New Jersey
November ??, 1999 Draft version 1.2MD1	 Add Maryland use to document – the changes were added to the version 1.2 of the regional standards Added Table of Contents Added Data Dictionary
December 23, 1999	Clarified use of X4 code for Maryland
Version 1.2MD2	Noted that BGE can only provide billed demand Classification of SETE states and SETE states are set to be set
January 17, 2000 Version 1.2MD3	 Clarified setting of DTM*649 for ESP consolidated bill Clarified REF*45 is only used when LDC sends transaction.
April 20, 2000 Version 1.2MD4	 Clarified APS use of REF*45 in MD Incorporate PA Change Control X015 to add X5 as a valid value for BPT04 Removed comment on mandatory use of PTD*BD loop for PA by 3/2000. This is being discussed as part of PA Change Control X018. While it is not determined if there are cases when this loop may be needed, it was agreed that it will not be mandatory by 3/2000. Add PA Notes Section Add MD Notes Section
May 17, 2000 Version 1.2MD5	• Incorporate PA Change Control X023 – allow PM loop to be optional on a cancellation
May 30, 2000 Version 1.2MD6	• Incorporate PA Change Control X018 – remove BD loop. PA decided this loop would not be used, and PA was the only state that intended to use this loop.
June 26, 2000 Version 1.2MD7	 Added clarity to Meter Multiplier and Transformer Loss Multiplier definitions in Data Dictionary Added clarity to example titles
August 14, 2000 Version 1.2MD8	 Add NJ Notes Section Add Note for PSE&G on BPT07 Added NJ Note for MEA05
September 10, 2000 Version 1.3	This transaction is a new FINAL version for Pennsylvania, New Jersey, Maryland, and Delaware (Delmarva only).
October 19, 2001 Version 1.3rev01	Incorporate Delaware Electric Coop (DEC) information for Delaware

December 13, 2001 Version 1.3rev02	 Incorporate PA Change Control 038 – change all references of PPL to PPL EU. Add clarification to NJ Notes section for PSE&G regarding support of detail interval data (summary level not an option). Also add PSE&G clarification on cancel / rebills for supplier other than supplier of record. Remove note indicating PSE&G does not support cross reference to the 810.
January 9, 2002 Version 2.0	 Incorporate SMECO specific data for MD (MD Change Control 003) This transaction is a new FINAL version for Pennsylvania, New Jersey, Maryland, and Delaware.
January 20, 2006 Version 2.0.1D	 Incorporate NJ Change Control 005 (NJ CleanPower program changes) Incorporate PA Change Control 039 to reflect "generated usage" Incorporate NJ Change Control 006 to reflect current operations
October 23, 2006 Version 2.0.2D	 Incorporate NJ Change Control 008 to reflect NJ CleanPower – unmetered usage for RECO) Incorporate NJ Change Control 009 to reflect NJ CleanPower change for partial usage. Add clarifying notes for NJ Net Metering.
February 12, 2007 Version 2.0.3F	Considered FINAL for PA and NJ
February 22, 2009 Version 2.0.4D	Incorporate NJ Change Control PSEG-E-Ref45
January 24, 2010 Version 2.1	This transaction is a new FINAL version for Pennsylvania, New Jersey, Maryland, and Delaware.
September 8, 2010 Version 2.1.1D	 Incorporate PA Change Control 060 – (PA Admin/Cleanup) Incorporate MD Change Control – Admin (Admin/Cleanup for MD)
February 28, 2011 Version 3.0	This transaction is a new FINAL version for Pennsylvania, New Jersey, Maryland, and Delaware.
February 16, 2012 Version 3.01	 Incorporate PA Change Control 093 (Admin Changes) Incorporate MD Change Control 010 (PEPCO AMI/Smart Meter support)
March 8, 2013 Version 6.0	 Moving to v6.0 to align versions across all transaction sets Cleaned up references to Allegheny and APS throughout document Incorporated PA Change Control 103 (uniform net meter consumption reporting)
March 17, 2014 Version 6.1	 Incorporate PA Change Control 105 Update2 (clarify net meter bank rollover) Incorporate PA Change Control 111 (clarify PECO use of BPT04) Incorporate PA Change Control 116 (update DLCO net meter looping) Incorporate MD Change Control 018 (clarify multiple meter exchanges) Incorporate MD Change Control 025 (867MU changes in PHI new CIS) Incorporate MD Change Control 028 (BGE support interval usage via EDI) Incorporate MD Change Control 029 (uniform net meter data reporting) Incorporate NJ Change Control Electric 016 (uniform net meter data reporting) Incorporate NJ Change Control Electric 020 (ACE new CIS; 867MU changes) Incorporate NJ Change Control Electric 031 (RECO removal from IG)
February 18, 2015 Version 6.2	• Incorporate MD Change Control 036 (clarify net meter customer excess generation)
February 5, 2016 Version 6.3	 Incorporate PA Change Control 127 (Clarify PA Notes for net meter bank rollover) Incorporate MD Change Control 039 (BGE net meter data reporting) Incorporate MD Change Control 042 (Clarify MD Notes for net meter bank rollover)
March 14, 2017 Version 6.4	Incorporate MD Change Control 048 (clarify Billed Demand reporting)
May 18, 2018 Version 6.5	 Incorporate PA Change Control 147 (Incorporate Citizens & Wellsboro into IG) Incorporate NJ Change Control Electric 040 (clarify Notes for PSEG Cancel/Rebill)
March 22, 2019 Version 6.6	 Incorporate MD Change Control 53 (Add new PTD*BJ loop) Incorporate NJ Change Control Electric 048 (NJ Note – End of Clean Power Choice)

March 31, 2020 Version 6.7	Incorporate PA Change Control 150v3 (FirstEnergy PA net meter data reporting)
March 25, 2021 Version 6.8	Incorporate NJ Change Control Electric 053 (Add support for PTD*BJ Loop)
April 30, 2024 Version 6.9	 Incorporate MD Change Control 076v2 (Add Supplier Consolidated Billing) Incorporate MD Change Control 081 (Update Notes Section for Typo)
March 15, 2024	 Incorporate MD Change Control 089 (Add Community Solar Support for PE) Incorporate NJ Change Control Electric 056v4 (JCPL Net update for Net Metering)

General Notes

PTD Loops Definition

The PTD Loops are required. Some are used individually, others are used in pairs. This section describes the purpose of each PTD loop. Depending on the characteristics of the account, there may be a different number of loops.

Monthly Billed Summary Information (PTD=BB): This loop is always required for every type of account if the LDC reads the meter.

Monthly Billed Summary (PTD01=BB): One PTD per Account – Data obtained from the billing system to reflect the billing data for this account.

Metered Services Information (PTD01 = SU, PM and BP) – These loops are used to convey the usage for metered data, at both a detail level by meter by unit of measure (PTD01=PM) and for some units of measure, at a summary level for all meters (PTD01=SU).

Metered Services Summary (PTD01=SU): Summing to the account level by kWh and KVARH. Data is obtained from the metering system. For every PTD01=SU, there must be a PTD01=PM. The PTD01=SU loop will NEVER be provided for kW or KVAR.

Metered Services Detail (PTD01=PM): One or more PTDs, one for each unit of measure for each meter. Data is obtained from the metering system. In the case of one meter reporting one unit of measure (kWh), the PTD01=PM will be the same as the PTD01=SU and both must be provided. If you have two meters and each meter measures kW and kWh, you will send one PTD SU Loop. The kWh readings from Meter 1 and Meter 2 will be summed and provided in one PTD SU Loop.

Bill Presentment Loop (PTD01 = BP): Maryland SCB Only

One or more PTD=BP loops, one for each meter and unit of measure will be created to provide the MD SCB usage related information. Data is obtained from multiple Utility systems and provided to Suppliers to ensure all required information currently printed on Utility Invoices as well as details required to explain the Utility Charges will be available. This BP Loop is based primarily on the PM loop and will be generated in addition to each PM loop for each meter and Unit of measure. If there are multiple PM loops for Consumption and Generation, then there will be a BP loop created for each. There will also be unmetered information passed in the BP loop.

<u>Unmetered Services Information</u> (PTD01 = BC) – This loop is used to convey the usage for any unmetered portion of an account. This information must be provided at the summary level (PTD01=BC).

Unmetered Services Summary (PTD01=BC): Total Consumption for all unmetered services at the account level. Even though some of the consumption may be estimated, the consumption is reported as actual for unmetered services. The summary is required at this time for Unmetered Services.

Generation Transferred In/Out (PTD01 = BJ) – MARYLAND & NEW JERSEY ONLY: This loop is used to convey the generation usage transferred in/out for the period. Required if the account has net metering or is a part of an Aggregated Net Energy Metering (ANEM) Family. Maryland: Required if the account has net metering or is a part of an Aggregated Net Energy Metering (ANEM) Family. New Jersey: Required if the account has net metering.

Cancellations

- The MEA is an optional segment on a cancellation.
- Cancel 867s will be by metering period, i.e. same as the original 867's. Rebills may be for multiple periods.
- The "from" and "to" dates on the cancel must match exactly with the original usage.
- On a cancellation, the signs are not reversed (don't change positive usage to negative usage). Quantities will not be negative on Cancels. Cancels should be interpreted as negative consumption.
- The consumption sent in the cancel must match the consumption sent in the original transaction.
- Cancels must be sent at the same level of detail as the original usage.
 - PA: Cancels must include all account and summary information, however, it is optional to include the PM loops.

Restatements

- In order to restate usage for a period, the metering party must first completely cancel all usage for that period; then send the full set of restatement transactions.
- If you receive a cancellation, you will not necessarily receive a restatement (i.e. if the data was sent to you in error in the first place).
- The "from" and "to" dates on the restatement transactions do not have to match the corresponding original or cancel transactions for the same period.
- Restatements across multiple cycles may match original from and to dates or may cross bill cycles.
- An 867 cancel can be followed by an 867 original the next month. The metering period would include the metering period from the cancelled and the current usage.

Reporting of usage if supplier is not providing 100% of generation

The usage information provided in the 867 is the total usage not the prorated information. Meter reading party will always send total consumption rounded to nearest kWh.

LDC Definitions:

The term LDC (Local Distribution Company) in this document refers to the utility. Each state may refer to the utility by a different acronym:

- EDC Electric Distribution Company (Pennsylvania, Delaware)
- LDC Local Distribution Company (New Jersey)
- EC Electric Company (Maryland)

ESP Definitions:

The term ESP (Energy Service Provider) in this document refers to the supplier. Each state may refer to the supplier by a different acronym:

- EGS Electric Generation Supplier (Pennsylvania)
- TPS Third Party Supplier (New Jersey)
- ES Electric Supplier (Delaware)
- ES Electricity Supplier (Maryland)

Cross Reference Number between 867, 810, and 820

There is a cross reference between billing related documents.

- 867 BPT02 This document establishes the cross reference number.
- 810 BIG05 This document must have the cross reference number from the respective 867.
- 820 REF6O (letter O) When making the other party whole, the 820 to the non-billing party must also include the cross reference number from 867/810 document.

Total Usage is sent, even if supplier is not providing 100% of load.

The usage information provided in the 867 is the total usage not the prorated information. Meter reading party will always send total consumption rounded to nearest kWh. It is the obligation of the receiving party to apply their participation percentage to the total provided to determine their actual obligation. If the decimal is .50000 or less, it will go to the lower whole number; if the decimal is .50001 or greater, it will go to the next higher whole number).

What document is sent if supplier elects NOT to receive detail interval data?

Pennsylvania Notes

If a supplier elects to receive only summary level information for an interval account, they will receive an 867MU document.

The 867IU document will be used when interval detail and summary level data is being sent.

Pennsylvania:

- Citizens and Wellsboro will provide detail interval data using 867IU with BB, BO, PM loops. The default is summary and 867MU and is sent with BB, SU, PM (BPT04 will be "DD").
- Duquesne Will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB, SU, and PM loops (BPT04 will be "X5").
- FIRST ENERGY Will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB, SU, and PM loops (BPT04 will be "X5").
- PECO If account-level interval detail is requested, will provide using 867IU with BB, SU, and BQ loops. If meter-level interval detail is requested, will provide using BB, BO, and PM loops. Else, will provide an 867MU with BB, SU, and PM loops (BPT04 in 867MU will be "DD" for AMR monthly metered accounts and "X5" for interval metered accounts).
- PPL EU Will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB and SU loops (BPT04 will be "DD")
- UGI No interval customers.

Requirements for uniform support of Net Metered Customers:

BB (Billed Summary) Loop —reports the monthly billed summary usage for net metered customers.

- a. All PA EDCs (Excluding FirstEnergy)
 - i. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption).
 - ii. When customer's generation is greater than consumption, the billed usage in the QTY02 will be reported as 0 (zero) KH.
 - iii. In either scenario, the QTY02 will never be signed negative.
- b. FirstEnergy Companies
- i. Reports the consumption (delivered) KH as the billed usage SU (Metered Services Summary) Loop –reports the summary usage for net metered customers.
 - a. All PA EDCs (Excluding FirstEnergy)
 - i. When the customer's consumption is greater than generation, the KH will be reported as net consumption (QTY01 w/actual = QD or estimated = KA) with the total generation subtracted from total consumption.
 - ii. When the customer's generation is greater than consumption, the KH will be reported as net generation (actual = 87 or estimated = 9H) with the total consumption subtracted from total generation).
 - iii. In either scenario, the QTY02 will never be signed negative.
 - b. FirstEnergy Companies
 - i. Instead of reporting net KH in SU loop, FirstEnergy will report the consumption and generation separately
 - Reports consumption (delivered) KH (QTY01 w/actual = QD or estimated = KA)
 - 2. Reports generation (generation) KH (QTY01 w/actual = 87 or estimated = 9H)

Requirements for uniform support of Net Metered Customers (continued):

PM (Meter Services Detail) Loop – The meter loop will report the meter level detail for net metered customers. This may be done via one of the three following configurations:

- 1. Single meter reporting both in and out flow. The PM loop for KH will be repeated, one reporting consumption and one reporting generation. Used by First Energy and PPL (MV90 only).
 - a. The meter number will be identical for each loop.
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA).
 - FirstEnergy Only: sends channel number (REF6W) with value of "1"
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H).
 - i. FirstEnergy Only:
 - 1. Sends channel number (REF6W) with value of "2"
 - 2. Sends generation loop even when there is no generation reported for the period.
 - d. The QTY02 will never be signed negative
 - e. Being this is a single meter, the meter attributes will remain the same for both PM loops.
- 2. Single meter reporting only the net consumption, one PM loop for KH. Used by PPL (non-MV90), Duquesne Light and Citizens & Wellsboro
 - a. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption). The meter role (REF*JH) will be 'A' (additive).
 - b. When customer's generation is greater than consumption, the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H). The meter role (REF*JH) will be 'S' (subtractive).
 - c. The QTY02 will never be signed negative.
- Separate meters, one reporting inflow and another meter reporting outflow. The PM loop will be repeated for KH, one meter reporting consumption and one meter reporting generation. Used by PECO and UGI.
 - a. The meter number should be unique for each KH loop. The meter attributes for each KH loop may have different values.
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA).
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H).
 - d. The QTY02 will never be signed negative.

Banked KH adjustment for excess customer generation:

Applies to FirstEnergy companies, PPLEU, Duquesne and UGI (PECO does NOT bank excess customer generation)

The LDC will apply excess generation KH from a prior month(s) into the billed quantity (D1) segment of the billed summary (BB) loop of the 867MU/IU transaction sets reducing billed consumption. When this occurs, the sum of the metered services (PM) loops will not equal the KH being reporting in the BB loop. In the event the banked KH is not exhausted it will carry over to the following month. Suppliers should understand this practice and examine current billing processes for net metered customers. In most cases, the customer's actual consumption and generation is made available in the PM (meter) loops of the 867MU/IU.

Settlement process for excess customer generation varies by EDC. EGSs should contact each EDC directly to obtain this information.

New Jersey Notes

Rockland Electric Company

What document is sent if supplier elects NOT to receive detail interval

data?

Cancel / Rebill when supplier is no longer

active supplier

Rockland Electric Company (RECO) does not utilize this EDI implementation guideline. RECO uses the New York EDI implementation guidelines.

The standard method for interval accounts is to always pass interval data.

- JCP&L JCP&L will allow the summary option under the same guidelines they use in PA. JCP&L will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB, SU, and PM loops (BPT04 will be "X5").
- Atlantic City Electric will allow a summary option. Atlantic City Electric will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB, SU, PM, and BC loops. (BPT04 will be "X5")
- PSE&G will not support supplier having a choice to receive summary only.

PSE&G: Before August 1st, 2016 (867 bill window close date)

PSE&G cannot provide consolidated billing for ESP's who are not supplier of record at the time the cancel / rebill is processed. The process for Cancel/ Rebill for an ESP who is not customer's current supplier of record is:

- PSE&G will cancel charges from 810(s) that correspond to the original 867(s) being canceled.
- Send 867(s) cancel
- Send 867(s) rebill noting that customer billing option is DUAL.
- PSE&G will issue an 820 and reduce a future payment by the amount of the canceled 810(s) (on the scheduled date of the 820).
- TPS must Dual bill customer for the rebilled 867(s).

PSE&G: On or After August 1st, 2016 (867 bill window close date)

PSE&G implemented a system enhancement that will allow the billing option to remain consolidated for a cancel/rebill processed after the customer-supplier relationship has

- PSE&G will cancel charges from 810(s) that correspond to the original 867(s) being canceled.
- Send 867(s) cancel
- Send 867(s) rebill noting that customer billing option is CONSOLIDATED.
- PSE&G will issue an 820 and reduce a future payment by the amount of the canceled 810(s) (on the scheduled date of the 820).
- TPS must send in 810 charges for the rebilled 867(s).
- PSE&G will issue an 820 for the amount of the 810(s) for the rebilled 867(s).

Net Metering Information:

PSE&G- Is currently using a bi-directional meter for the TPS's and providing the in reading as well as the out reading to the EDI process. For Clean Power suppliers a watthour meter which goes both ways ultimately provides the net usage to the EDI process.

Atlantic City Electric- Is currently using watt-hour meters that go both ways ultimately providing the net usage to the EDI process. This is for both the TPSs as well as the Clean Power providers.

JCP&L-Is currently using a bi-directional meter for both the TPS's as well as the Clean Power suppliers. The bi-directional meter is providing the in and the out reading to the EDI process. The EDI summary loop will include the net usage.

Data Requirements for uniform support of Net Metered Customers:

- BB (Billed Summary) Loop –reports the monthly billed summary usage for net metered customers.
 - 1. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption).
 - 2. When customer's generation is greater than consumption, the billed usage in the QTY02 will be reported as 0 (zero) KH.
 - 3. In either scenario, the QTY02 will never be signed negative.
- SU (Metered Services Summary) Loop –reports the summary usage for net metered customers. All NJ LDCs (excluding JCP&L)
 - 1. When the customer's consumption is greater than generation, the KH will be reported as net consumption (QTY01 w/actual = QD or estimated = KA) with the total generation subtracted from total consumption.
 - 2. When the customer's generation is greater than consumption, the KH will be reported as net generation (actual = 87 or estimated = 9H) with the total consumption subtracted from total generation).
 - 3. In either scenario, the QTY02 will never be signed negative.
- SU (Metered Services Summary) Loop –reports the summary usage for net metered customers.(JCP&L)
 - 1. Consumption (Usage) KH reported under QTY*QD segment
 - 2. Generation KH reported under QTY*87 (or 9H) segment
 - 3. In either scenario, the QTY02 will never be signed negative.
- PM (Meter Services Detail) Loop The meter loop will report the meter level detail for net metered customers. This may be done via one of the three following configurations:
 - 1. Single meter reporting both in and out flow. The PM loop for KH will be repeated, one reporting consumption and one reporting generation. Used by Atlantic City Electric and PSE&G (Note: PSE&G sends one PM loop with separate QTY segments reporting generation and consumption)
 - a. The meter number will be identical for each loop. (Note: PSE&G sends one PM loop)
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA). (PSE&G sends meter role of 'A')
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H). (N/A to PSE&G)
 - d. The QTY02 will never be signed negative
 - e. Being this is a single meter, the meter attributes will remain the same for both PM loops. (PSE&G sends one PM loop)
 - 2. Single meter reporting only the net consumption, one PM loop for KH. (Used by Atlantic City Electric)
 - a. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption). The meter role (REF*JH) will be 'A' (additive).
 - b. When customer's generation is greater than consumption, the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H). The meter role (REF*JH) will be 'S' (subtractive).
 - c. The QTY02 will never be signed negative.

Data Requirements for uniform support of Net Metered Customers (Continued):

NJ Clean Power Choice

- 3. Single meter, separate PM loops. The PM loop will be repeated for KH, one loop reporting consumption and one loop reporting generation. (Used by JCP&L)
 - a. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA). The REF*6W Delivery Channel will be "1".
 - b. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as generation delivered (actual = 87 or estimated = 9H). The REF*6W Delivery Channel will be "2".
 - c. The QTY02 will never be signed negative.
- Separate meters, one reporting inflow and another meter reporting outflow. The PM loop will be repeated for KH, one meter reporting consumption and one meter reporting generation.
 - a. The meter number should be unique for each KH loop. The meter attributes for each KH loop may have different values.
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA).
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H).
 - d. The QTY02 will never be signed negative.

Pursuant to Board Order, Docket No. QO18040393, the Clean Power Choice Program is coming to an end effective February 28, 2019. The EDI segments and data elements used for Clean Power Choice will remain in the EDI Implementation Guidelines to support any cancel/rebill scenarios or for future use in the event another program is established that may need these data elements

Maryland Notes

What document is sent if supplier elects NOT to receive detail interval data? If a supplier elects to receive only summary level information for an interval account, they will receive an 867MU document.

With PHI new CIS, the 'SI' process will be supported by ALL interval metered accounts, not just those with smart meters.

Note: BGE – The default is that an ESP will receive interval data at the summary level only (BPT04 = DD)

- If an ESP wants to receive interval data at the detail level for AMI/Smart metered accounts, the ESP must submit "SI" in the LIN05 and "DETAIL" in the REF17.
- The ESP may request detail level interval data post enrollment by submitting a Change Request at a later date.
- For non-AMI/Smart metered interval accounts, the ESP will receive 867MU with the detail interval data posted to BGE's website.

If a supplier elects to receive detail and summary level information for an interval account, this is what they will receive, by utility.

- Delmarva & PEPCO Supplier will receive 867IU for all accounts (unless supplier has requested summary data. If the supplier elects NOT to receive detail interval data, PHI will send EDI 867MU (BB/SU/PM/BC loops) with BPT04 = 'X5' for accounts the supplier requested summary interval usage. BG&E For AMI/Smart metered accounts, will provide 867IU if requested as stated above. For non-AMI/Smart metered accounts, no 867IU will be sent. Interval data will be provided on web; however, an 867MU will be provided for the Summary data.
- Potomac Edison Will provide detail interval data using 867IU with BB, SU, and BQ loops. If summary level is requested, will provide an 867MU with BB, SU, and PM loops (BPT04 will be "X5").

Looping of DTM segments in the PM (meter) loop when multiple meter exchanges occur during the same service period If the event the utility experiences multiple meter exchanges during the same service period, the following format applies.

867MU – PTD*PM Loop – Position 020

DTM*150*20130114 – Service Period Start
DTM*514*20130117 – First Meter Exchange on 1/17/2013
DTM*514*20130117
DTM*514*20130119 – Second Meter Exchange on 1/19/2013
DTM*514*20130119
DTM*151*20130213 – Service Period End

Requirements for uniform support of Net Metered Customers:

- BB (Billed Summary) Loop –reports the monthly billed summary usage for net metered customers
 - 1. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption).
 - 2. When customer's generation is greater than consumption, the billed usage in the QTY02 will be reported as 0 (zero) KH.
 - 3. In either scenario, the QTY02 will never be signed negative.
- SU (Metered Services Summary) Loop –reports the summary usage for net metered customers.
 - 1. When the customer's consumption is greater than generation, the KH will be reported as net consumption (QTY01 w/actual = QD or estimated = KA) with the total generation subtracted from total consumption.
 - 2. When the customer's generation is greater than consumption, the KH will be

- reported as net generation (actual = 87 or estimated = 9H) with the total consumption subtracted from total generation).
- 3. In either scenario, the QTY02 will never be signed negative.
- PM (Meter Services Detail) Loop The meter loop will report the meter level detail for net metered customers. This may be done via one of the three following configurations:
 - 1. Single meter reporting both in and out flow. The PM loop for KH will be repeated, one reporting consumption and one reporting generation. (Delmarva, PEPCO)
 - a. The meter number will be identical for each loop.
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA).
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H).
 - d. The QTY02 will never be signed negative
 - e. Being this is a single meter, the meter attributes will remain the same for both PM loops.
 - 2. Single meter reporting only the net consumption, one PM loop for KH. (Potomac Edison& BGE non-Time of Use. See below for BGE Time of Use reporting))
 - a. When customer's consumption is greater than generation, the billed KH usage in the QTY02 will be reported as net KH (generation subtracted from total consumption). The meter role (REF*JH) will be 'A' (additive).
 - b. When customer's generation is greater than consumption, the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H). The meter role (REF*JH) will be 'S' (subtractive).
 - c. The QTY02 will never be signed negative.
 - 3. Separate meters, one reporting inflow and another meter reporting outflow. The PM loop will be repeated for KH, one meter reporting consumption and one meter reporting generation.
 - a. The meter number should be unique for each KH loop. The meter attributes for each KH loop may have different values.
 - b. In the consumption loop, the meter role (REF*JH) will be 'A' (additive) and the KH usage will be reported in quantity delivered (actual = QD or estimated = KA).
 - c. In the generation loop, the meter role (REF*JH) will be 'S' (subtractive) and the KH usage will be reported as net generation delivered (actual = 87 or estimated = 9H).
 - d. The QTY02 will never be signed negative.

Demand Reporting – Multiple suppliers during same billing period The following describes each utility's process for reporting Demand (K1) when multiple suppliers serve the same customer during the same billing period.

BGE

The demands passed in each 867MU/IU reflects the highest demand values that occurred during each supplier's sub-period, NOT the entire billing period. Demand values for each sub-period are NOT prorated.

BB Loop / QTY*D1 - The highest overall demand (regardless of TOU Peak) that occurred in the supplier's sub-period. Although coded "D1", this may not be the highest overall demand billed by BGE for the entire billing period.

BB Loop / QTY*QD - The highest recorded On Peak demand that occurred in the supplier's

sub-period (This may or may not be the highest overall billed "D1" demand).

Potomac Edison (FirstEnergy)

Will send the peak demand for the entire billing period in all 867s created for the period. If the customer's peak demand is 10.4 K1 for the whole billing period, all suppliers would receive 10.4K1 in their 867.

PHI (Delmarva MD & PEPCO MD)

Will prorate demand for the entire period based on the number of days served by the supplier.

If max demand for entire period is 90 and one supplier serves 15/30 days, PHI will send that supplier 45, if another supplier serves 10/30 days, will send that supplier 30, and if utility has remaining 5/30 days, they will have 15. PHI will implement this to be consistent with all meter types and to ensure the customer is never charged more than the maximum.

Requirements for BGE non-residential Time of Use (TOU) Net Metered Customers:

BGE non-residential Time of Use (TOU) only, refer to above section for non-TOU customer net metering data reporting requirements.

Samples provided in the back of this implementation guideline.

BGE's process 'trues up' customer net metering bank(s) upon supplier switch. BGE is settling on the KH value in the BB (billed) loop at PJM. BGE maintains a 'bank' for each TOU reading. When a customer's TOU reading for the month is generation it is placed into the bank. Once the TOU reading for the month is positive consumption, BGE will apply the bank. This process is not shown in the PM loop, as the PM loop is reporting meter readings not billing adjustments.

BB (Billed Summary) Loop —reports the monthly billed summary usage for net metered customers.

- 1. BGE will bill all positive consumption for each TOU reading minus any banked excess generation.
- 2. The QTY02 will never be signed negative.

SU (Metered Services Summary) Loop —reports the summary usage for net metered customers. This reports the customer's net usage for the billing period.

- 1. When the customer's consumption is greater than generation, the KH will be reported as net consumption (QTY01 w/actual = QD or estimated = KA) with the total generation subtracted from total consumption.
- 2. When the customer's generation is greater than consumption, the KH will be reported as net generation (actual = 87 or estimated = 9H) with the total consumption subtracted from total generation).
- 3. In either scenario, the QTY02 will never be signed negative.

PM (Meter Services Detail) Loop – The meter loop reports the meter level detail for TOU net metered customers from the metering system. Single meter reporting On-Peak, Off-Peak and Intermediate-Peak Time TOU in one PM loop.

- 1. The meter role (REF*JH) will always report as additive (REF*JH*A) regardless if any generation is reported in the PM loop.
- 2. Each TOU reading may be reported as consumption (QTY01 w/actual = QD or estimated = KA) or generation (QTY01 w/actual = 87 or estimated = 9H) based on the usage. Note the TOU readings in the PM loop will not be based on the meter role, there will be cases where at least one TOU is generation and the meter role is 'Additive'.
- 3. The QTY02 will never be signed negative

Net Metering – Excess Customer Generation

Maryland legislation PUA 7-306 states the Electric Company, not the Electricity Supplier, must pay the customer for accrued net excess generation on an annual basis (April meter read). Furthermore the rule states... "For customers served by an electricity supplier, the dollar value of the net excess generation shall be equal to the generation or commodity rate that the customer would have been charged by the electricity supplier multiplied by the number of kilowatt—hours of net excess generation." To support this requirement, each LDC maintains customer generation balance and for any excess generation during the annual true-up, the customer is credited based on their LDC or EGS rate.

Net Metering – banked KH adjustment for excess customer generation

Applies to Potomac Edison, BG&E, Delmarva MD and PEPCO MD

The LDC will apply excess generation KH from a prior month(s) into the billed quantity (D1) segment of the billed summary (BB) loop of the 867MU/IU transaction sets reducing billed consumption. When this occurs, the sum of the metered services (PM) loops will not equal the KH being reporting in the BB loop. In the event the banked KH is not exhausted it will carry over to the following month.

With MD EDI Change Control 053, the Generation Transferred In/Out (PTD01 = BJ) loop will identify the generation kWh being transferred In/Out as well as any Starting Bank or Ending Bank generation kWh.

In conjunction with Maryland excess generation rules, the EGS should understand this banked rollover practice and examine current billing processes for net metered customers. Example of banked KH adjustment (non-TOU customers)...

Month 1 – Customer consumes 200KH and generates 500KH, net is excess generation of 300KH. The utility sends 0KH in BB loop. Supplier would bill customer 0 KH

Month 2 – Customer consumes 500KH and generates 150KH, net is consumption of 350KH. The utility rolls banked excess of 300KH from prior month and applies to current month bill. Utility and supplier bill customer for 50KH (350KH – 300KH)

Settlement process for excess customer generation varies by LDC. Suppliers should contact each LDC directly to obtain this information.

MD Supplier Consolidated Billing (SCB)

MD SCB Usage Considerations:

MD SCB Bill Option includes a Purchase of Receivables process in which the Supplier is responsible for creating the consolidated customer bill utilizing information obtained via numerous EDI transactions including an 810 Invoice, 867MU or 867IU usage transactions, and the 814 Enrollment response and change transactions sent to the Supplier by the Utility. The following changes to the 867MU are to ensure the Supplier has access to data currently printed on the Utility bills that is required to be present on the MD SCB bill, as well as additional information that provides support for explaining Utility charges.

Bill Presentment - PTD=BP

Utilities will provide Meter Beginning Reading and Meter Ending Reading values on the MEA05 and MEA06 when available for the Supplier to include on the Customer SCB bill. There are some instances where this information is not currently provided consistently on the PM loops. The LDC Rate Description will be provided in a new REF*K6 segment for all MD SCB accounts.

Utilities will also provide the following information when available and appropriate:

MU=Meter Multiplier (The meter multiplier will always be passed even when equal to 1.0). ZA=Power Factor

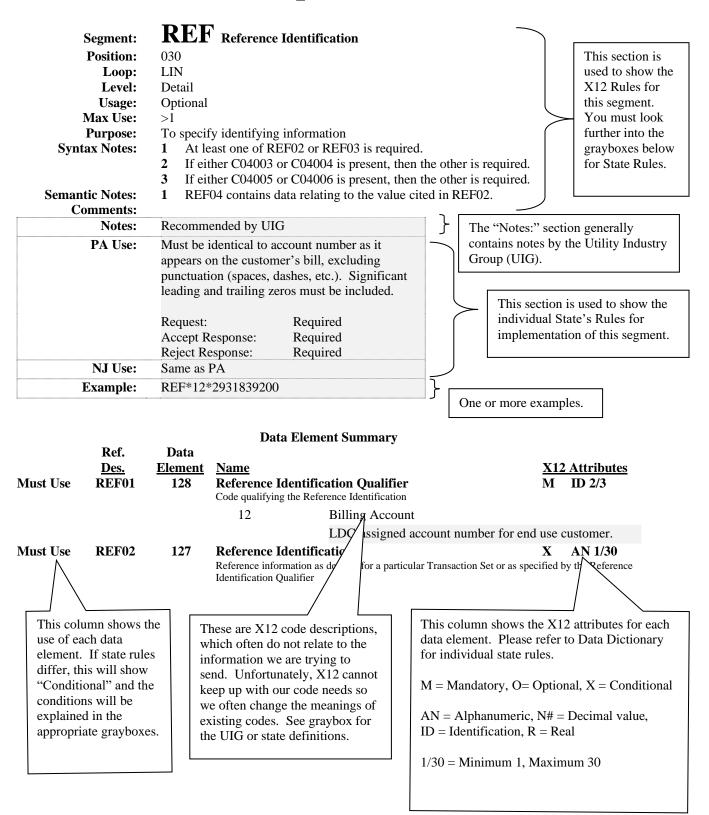

CO=Transformer Loss Multiplier

Unmetered Services Information - PHI and Potomac Edison provide Unmetered usage at the device level on their current Utility Bills. BGE does not currently provide this detail on their bills and will not be required to send this information to MD SCB Suppliers at this time.

PHI and Potomac Edison will provide Unmetered Device Description, number of devices and usage in the BP loop for each unmetered device. PHI, Potomac Edison and BGE will provide an unmetered summary loop (PTD01= BC), containing total unmetered usage for the account.

The PTD*BJ Loop is required for MD SCB 867 transactions for Potomac Edison that also participate in Community Solar programs. The BJ loop will provide information to be printed on the customer bill including the kwh amount of the usage base CS credit and the name of the community Solar program.

How to Use the Implementation Guideline

47	Quantity Delivered	Represents quantity of consumption delivered for service period. Contains the difference in the meter readings (or as measured by the meter) multiplied by various factors, excluding Power Factor.	QTY02	QTY01	9(10).9(4
48	Quantity Delivered Unit of Measurement	Indicates unit of measurement for quantity of consumption delivered during service period.	QTY03		X(2)
49	Measurement Reference Code	Code identifying category to which measurement applies.	MEA01		X(2)
50	Consumption	Represents quantity of consumption delivered for service period. Contains the difference in the meter readings (or as measured by the meter) multiplied by various factors, excluding Power Factor.	MEA03	MEA02 = PRQ	9(9).9(4)
51	Unit of Measure	Unit of measure for readings.	MEA04		X(2)
52	Beginning Reading	Value specifying beginning reading for the metering period. Factors have not been applied to this value.	MEA05		9(8).9(4)
53	Ending/Single Reading	The ending reading or single reading for metering period. Factors have not been applied to this value.	MEA06		9(8).9(4)
54	Measurement Significance Code	Code used to benchmark, qualify, or further define a measurement value.	MEA07		X(2)
55	Meter Multiplier	Meter Constant - used to represent how many units are reflected by one dial or digit increment.	MEA03	MEA02 = MU	9(9).9(4)
56	Power Factor	Relationship between watts and volt - amperes necessary to supply electric load	MEA03	$MEA02 = \mathbf{ZA}$	9(9).9(4)
57	Transformer Loss Multiplier	Used when a customer owns a transformer and the transformer loss is not measured by the meter. Consumption figures from meter must be adjusted by this factor to reflect true end use consumption.	MEA03	MEA02 = CO	9(9).9(4)
	Unmetered Services	Summary - Loop required if there are unmet	tered services	on the accoun	ıt
58		Unmetered Services Summary	PTD01= BC		X(2)
59	Service Period Begin Date	Start date of the period for which the readings are provided	DTM02	DTM01 = 150	9(8)
60	Service Period End Date	End date of the period for which the readings are provided	DTM02	DTM01 = 151	9(8)

61	Quantity Qualifier	Represents that the quantity is actual: QD = Actual Quantity Delivered	QTY01		X(2)
62	Quantity Delivered		QTY02	QTY01	9(10).9(4
63	Quantity Delivered Unit of Measurement	Indicates unit of measurement for quantity of consumption delivered during service period.	QTY03		X(2)
		Bill Presentation Loop – Maryland SCB	only		
63.01	Product Transfer Type	Metered Services Detail	PTD01= BP		X(2)
	Service Period Begin Date	the changed in meter.	DTM02	DTM01 = 150	9(8)
63.03	Service Period End Date	End date of the service period or end date of the changed-out meter.	DTM02	DTM01 = 151	9(8)
63.04	Meter Change Out Date	Used in conjunction with either the Service Period Start Date or the Service Period End Date to indicate when a meter has been replaced. Separate PTD loops must be created for each period and meter.	DTM02	DTM01 = 514	X(12)
63.05	Meter Number	Serial number of this specific meter (may have multiple meters). Metered accounts will have the Meter Number. Unmetered accounts will have the value UNMETERED.	REF02 Meter Number or "UNMETE RED"	$REF01 = \mathbf{MG}$	X(30)
63.06	LDC Rate Code	Code indicating the rate a customer is being charged by LDC per tariff. Codes posted on LDC's Web site	REF02	REF01 = NH	X(30)
63.07	LDC Rate Subclass Code	Used to provide further classification of a rate.	REF02	REF01= PR	X(30)
63.075	LDC Print Summary Box Indicator	Used to Identify Additional Utility Bill print requirements.	REF02= (Y or N)	REF01= K6	X(30)
63.076	LDC Rate Description	Rate Description required per current Utility Bill requirements.	REF03	REF01= K6	X(80)
63.08	Meter Role	Effect of consumption on summarized total. S = Subtractive (consumption subtracted from summarized total). A = Additive (consumption contributed to summarized total - do nothing). I = Ignore (consumption did not contribute to summarized total - do nothing).	REF02	REF01 = JH	X(30)
63.09	Number of Dials / Digits and related decimal positions	Needed to determine usage if meter reading rolls over during the billing period. Number of dials on the meter displayed as the number of dials to the left of the decimal, a decimal point, and number of dials to the right of the decimal.		REF01 = IX	9.9
63.10	Quantity Qualifier	Represents whether the quantity is actual or estimated: KA = Estimated Quantity Delivered QD = Actual Quantity Delivered 87 = Actual Quantity Received (Net Meter) 9H = Estimated Quantity Received (Net	QTY01		X(2)
63.11	Quantity Delivered	Represents quantity of consumption delivered for service period. Contains the difference in the meter readings (or as measured by the meter) multiplied by various factors,	QTY02	QTY01	9(10).9(
	0.453.6	hlv. Haaga (4010) 26	IC067MII7		

		excluding Power Factor.

71	Consumption	Represents quantity of consumption delivered for service period. Contains the difference in the meter readings (or as measured by the meter) multiplied by various factors, excluding Power Factor.	MEA03	MEA02 = PRQ	9(9).9(4)
72	Unit of Measure	Unit of measure for readings.	MEA04		X(2)
73	Measurement Significance Code	Code used to benchmark, qualify, or further define a measurement value.	MEA07		X(2)

Segment: ST Transaction Set Header

Position: 010

Loop:

Level: Heading Usage: Mandatory

Max Use:

Purpose: To indicate the start of a transaction set and to assign a control number

Syntax Notes:

Semantic Notes: 1 The transaction set identifier (ST01) is used by the translation routines of the

interchange partners to select the appropriate transaction set definition (e.g., 810

selects the Invoice Transaction Set).

Comments:

PA Use:	Required
NJ Use:	Required
DE Use:	Required
MD Use:	Required
Example:	ST*867*00000001

Must Use	Ref. <u>Des.</u> ST01	Data Element 143	Name Transaction Set Identifier Code Code uniquely identifying a Transaction Set	Att M	ributes ID 3/3

	86	7 Monthly U	Usage (4010)	30 IG867MUv7-0	0.docx

X4 Summary Report (defined for PA and MD)

For interval metered customers, when only summary data

is being sent at the ACCOUNT level.

PA Note: Some utilities may not be able to comply with this until later since this was added so close to the 4010 implementation date. If the utilities can not comply day 1,

the utility will send the code of "DD"

MD Note: Use of the "X4" code on the 867MU indicates

the interval detail will be provided on the web.

X5 Restricted Report

For interval metered customers, when only summary data

is being sent at the METER level.

PA Note: Mandatory implementation date is June 2000.

Conditional BPT07 306 Action Code

O AN 1/2

Code indicating type of action

Final – Indicates Final Usage for specific ESP.

Condition: Code to indicate this is the final usage data being sent for this customer. Either the customer account is final with the LDC or the customer switched to a new

ESP.

NJ PSE&G: PSE&G only sends "F" on a customer account final. They do not send an "F" on a customer

witch.

Conditional BPT09 127 Reference Identification

O AN 1/30

Reference information as defined for a particular Transaction Set or as specified by the Reference Identification Qualifier

Condition: When this is a cancellation of usage, that is BPT01 = 01, this element is required and should contain the transaction identification number from BPT02 of the transaction that is being cancelled.

Segment: DTM Date/Time Reference (649=Document Due Date)

Position: 050

Loop:

Level: Heading Usage: Optional Max Use: 10

Purpose: To specify pertinent dates and times

Syntax Notes: 1 At least one of DTM02 DTM03 or DTM05 is required.

If DTM04 is present, then DTM03 is required.

3 If either DTM05 or DTM06 is present, then the other is required.

Semantic Notes:

Comments:

Notes:	Required for Bill Ready Consolidated Billing where the meter reading party sends an 867 to the non-billing party, who calculates their own portion of the bill and sends the 810 to the billing party. Must be expressed in Eastern Prevailing Time. Not provided on cancel transaction.
PA Use:	Required for Bill Ready, not used in Rate Ready or Dual Billing Note: For ESP Consolidated Billing, the document due date will be set according to the specific LDC bill ready implementation.
NJ Use:	Required for Bill Ready, not used in Rate Ready or Dual Billing
DE Use:	Required for Bill Ready, not used in Rate Ready or Dual Billing
MD Use:	Required for Bill Ready, not used in Rate Ready or Dual Billing
Examples:	DTM*649*19990131*2359

				ESP, or whether each party will render	r their	own bill.
				See REF02 for valid values.		
Must Use	REF02	127	Reference Identific	cation	X	AN 1/30

Reference information as defined for a particular Transaction Set or as specified by the Reference Identification Qualifier

When REF01 is BLT, valid values for REF02 are:

LDC - The LDC bills the customer ESP - The ESP bills the customer

DUAL - Each party bills the customer for their portion

Note: In New Jersey, only LDC and DUAL are valid.

Position: 120
Loop: N1
Level: Heading
Usage: Optional
Max Use: 12

Purpose: To specify identifying information

Syntax Notes: 1 At least one of REF02 or REF03 is required.

If either C04003 or C04004 is present, then the other is required.
If either C04005 or C04006 is present, then the other is required.

Semantic Notes: 1 REF04 contains data relating to the value cited in REF02.

Comments:

PA Use:	Required
NJ Use:	Required
DE Use:	Required
MD Use:	Required
Example:	REF*PC*LDC

Data Element Summary

Must Use	Ref. <u>Des.</u> REF01	Data <u>Element</u> 128	Name Reference Identific Code qualifying the Refe	•	<u>X12</u> M	2 Attributes ID 2/3
			PC	Production Code		
				Identifies the party that is to calculate bill.	the cl	harges on the
Must Use	REF02	127	Reference Identific Reference information as	eation defined for a particular Transaction Set or as spe	X cified l	AN 1/30 by the Reference

Reference information as defined for a particular Transaction Set or as specified by the Reference Identification Qualifier

When REF01 is PC, valid values for REF02 are:

LDC - The LDC calculates the charges on the bill (Rate Ready)

DUAL - Each party calculates its portion of the bill (Dual or Bill Ready)

	IF	THEN		
Bills the	Calci	ulates	Billing Party	Calc. Party
Customer	LDC Portion	ESP Portion	REF*BLT	REF*PC
LDC	LDC	LDC	LDC	LDC
LDC	LDC	ESP	LDC	DUAL
ESP	LDC	ESP	ESP	DUAL
DUAL	LDC	ESP	DUAL	DUAL

Be careful to use the UIG Standard Code Values LDC and ESP rather than the Pennsylvania versions of those codes.

 $\textbf{Segment:} \quad \textbf{PTD} \text{ Product Transfer and Resale Detail (BB=Billed Summary)}$

Position: 010 Loop: PTD Level: Detail Usage: Mandatory

Max Use:

Purpose: To indicate the start of detail information relating to the transfer/resale of a product and

provide identifying data

Optional	REF03	352	Description A free-form description	n to clarify the related data elements and their conte	X nt	AN 1/80
			Optional use: See	Meter Type (REF*MT) on 814 Enrollmen	nt for	valid codes.

# Dials	Positions to	Positions to	X12 Example
	left of decimal	right of decimal	
6	6	0	REF*IX*6.0
6	5	1	REF*IX*5.1
6	4	2	REF*IX*4.2

Segment: QTY Quantity

Position: 110
Loop: QTY
Level: Detail
Usage: Optional

Max Use: 1

Purpose: To specify quantity information

Syntax Notes: 1 At least one of QTY02 or QTY04 is required.

2 Only one of QTY02 or QTY04 may be present.

Semantic Notes: 1 QTY04 is used when the quantity is non-numeric.

Comments:

Comments.	
Notes:	There will be one QTY loop for each of the QTY03 Units of Measurement listed below for each meter that is measured on this account.
	If there are 2 meters on the account, and one measures KWH and KW, and the other measures just KWH, there will be 3 PTD01=PM loops.
	If a meter measures total usage, as well as on-peak and off-peak, there will be three QTY loops sent within one PTD01=PM loop. The MEA segment that follows each QTY will specify which time of use the QTY applies to.
PA Use:	Required if there are metered services on the account.
NJ Use:	Same as PA
DE Use:	Same as PA
MD Use:	Same as PA
Example:	QTY*QD*22348*KH QTY*QD*14*K1 (If meter measures both, you will have two QTY loops)

Must Use	Ref. <u>Des.</u> QTY01	Data Element 673	Name Quantity Qualifier Code specifying the type	
			KA	Estimated Quantity Delivered Used when the quantity delivered is an estimated quantity.
			QD	Actual Quantity Delivered Used when the quantity delivered is an actual quantity.
			87	Actual Quantity Received (Net Metering) Used when the net generation quantity received is actual.
			9Н	Estimated Quantity Received (Net Metering) Used when the net generation quantity received is estimated.
Must Use	QTY02	380	Quantity Numeric value of quantity	X R 1/15
Must Use	QTY03	355	Unit or Basis for M Code specifying the units has been taken	Teasurement Code M ID 2/2 in which a value is being expressed, or manner in which a measurement
			K1	Kilowatt Demand (kW)
			K2	Represents potential power load measured at predetermined intervals Kilovolt Amperes Reactive Demand (kVAR)
				Reactive power that must be supplied for specific types of customer's equipment; billable when kilowatt demand usage meets or exceeds a defined parameter

K3 Kilovolt Amperes Reactive Hour (kVARH)

> Represents actual electricity equivalent to kilowatt hours; billable when usage meets or exceeds defined

parameters

Kilovolt Amperes (KVA) K4 KH Kilowatt Hour (kWh)

Segment: MEA Measurements

Position: 160
Loop: QTY
Level: Detail
Usage: Optional
Max Use: 40

Purpose: To specify physical measurements or counts, including dimensions, tolerances, variances,

and weights (See Figures Appendix for example of use of C001)

Syntax Notes: 1 At least one of MEA03 MEA05 MEA06 or MEA08 is required.

2 If MEA05 is present, then MEA04 is required.3 If MEA06 is present, then MEA04 is required.

4 If MEA07 is present, then at least one of MEA03 MEA05 or MEA06 is required.

5 Only one of MEA08 or MEA03 may be present.

Semantic Notes: 1 MEA04 defines the unit of measure for MEA03, MEA05, and MEA06.

Comments: 1 When citing dimensional tolerances, any measurement requiring a sign (+ or -), or any measurement where a positive (+) value cannot be assumed, use MEA05 as the

negative (-) value and MEA06 as the positive (+) value.

	negative () value and with 100 as the positive (1) value.
Notes:	The MEA segment is sent for each QTY loop. The MEA will indicate the "time of use" that applies to the QTY. If meter readings are included in the MEA, they will indicate the
	"time of use" that the meter readings apply to.
PA Use:	Required (optional on a cancellation)
NJ Use:	Same as PA
DE Use:	Same as PA
MD Use:	Same as PA
Examples:	MEA*AA*PRQ*22348*KH***51
	MEA*AA*PRQ*14*K1***51 (If meter measures multiple things, you need to send multiple QTY loops, one for each unit of measurement).

Segment: QTY Quantity

Position: 110
Loop: QTY
Level: Detail
Usage: Optional

Max Use: 1

Purpose: To specify quantity information

Syntax Notes: 1 At least one of QTY02 or QTY04 is required.

2 Only one of QTY02 or QTY04 may be present.

Semantic Notes: 1 QTY04 is used when the quantity is non-numeric.

Comments:

There will be one QTY loop for each of the QTY03 Units of Measurement listed below for each meter that is measured on this account.
If there are 2 meters on the account, and one measures KWH and KW, and the other measures just KWH, there will be 3 PTD01=PM loops.
If a meter measures total usage, as well as on-peak and off-peak, there will be three QTY loops sent within one PTD01=PM loop. The MEA segment that follows each QTY will specify which time of use the QTY applies to.
Not Used
Not Used
Not Used
Conditional: Required for MD SCB if present on corresponding 867MU PTD-PM Loop and when the REF*MG Meter number = UNMETERED with the REF*K6 Print Summary Box = Y. (REF*MG*UNMETERED and REF*K6*Y*Unmetered Street Lighting) One QTY Loop is required for each consumption quantity per unmetered device. The billable quantity is the total unmetered consumption per device type for the billable period.
QTY*QD*22348*KH QTY*QD*14*K1 (If meter measures both, you will have two QTY loops) QTY~QD~2000~EA^^20^KH

Segment: MEA Measurements

Position: 160
Loop: QTY
Level: Detail
Usage: Optional
Max Use: 40

Purpose: To specify physical measurements or counts, including dimensions, tolerances, variances,

and weights (See Figures Appendix for example of use of C001)

Syntax Notes: 1 At least one of MEA03 MEA05 MEA06 or MEA08 is required.

2 If MEA05 is present, then MEA04 is required.3 If MEA06 is present, then MEA04 is required.

4 If MEA07 is present, then at least one of MEA03 MEA05 or MEA06 is required.

5 Only one of MEA08 or MEA03 may be present.

Semantic Notes: 1 MEA04 defines the unit of measure for MEA03, MEA05, and MEA06.

Comments: 1 When citing dimensional tolerances, any measurement requiring a sign (+ or -), or any measurement where a positive (+) value cannot be assumed, use MEA05 as the

negative (-) value and MEA06 as the positive (+) value.

Notes:	The MEA segment is sent for each QTY loop. The MEA will indicate the "time of use" that applies to the QTY. If meter readings are included in the MEA, they will indicate the "time of use" that the meter readings apply to.
PA Use:	Not Used
NJ Use:	Not Used
DE Use:	Not Used
MD Use:	Conditional: Required for MD SCB if present on corresponding PTD-PM Loop and to provide additional information for bill presentment purposes. MEA segment must contain MEA05 and MEA06 Meter Beginning Reading and Meter Ending Reading values on KH reads. BGE does not provide on TOU reads, only total usage segments.
Examples:	MEA*AE*PRQ*589.00000*KH*89466.00000*90055.00000*51 MEA*BO*RUD*243342*KH***51

	Child account.							
	$\overline{OTY01} = 78$: required in ANEM family accounts when generation is transferred out of the							
	account. Not used for net metered accounts not part of ANEM family.							
	OTY01 = 79: required in ANEM family accounts and regular net metered accounts not part of							
	ANEM family when there is excess generation self-applied from the Starting Bank.							
	QTY01 = QB: required in ANEM family accounts and regular net metered accounts not part of							
	ANEM family when there is excess generation for a True-Up event.							
	<u>QTY01 = QH (Starting Bank) & QE (Ending Bank):</u> required for the PARENTHOST account and CHILD accounts with net metering under the ANEM family. Also required for any net metered							
	account that is not part of the ANEM family. These segments will be sent even where the value is							
	0 kWh. Not sent under the PARENT account for PHI.							
Example:	QTY*77*1000*KH Example generation transferred in to this child account							
	MEA*AF*PRQ*1000*KH***51							
	QTY*78*750*KH Example generation transferred out from TOU parent account							
	MEA*AF*PRQ*400*KH***41							
	MEA*AF*PRQ*300*KH***42							
	MEA*AF*PRQ*50*KH***43							
	Additional examples provided in the back of this Implementation Guideline.

MEA Measurements **Segment:**

Position: 160 Loop: QTY Level: Detail Usage: Optional Max Use:

Purpose: To specify physical measurements or counts, including dimensions, tolerances, variances,

and weights (See Figures Appendix for example of use of C001)

At least one of MEA03 MEA05 MEA06 or MEA08 is required. **Syntax Notes:**

If MEA05 is present, then MEA04 is required. 3 If MEA06 is present, then MEA04 is required.

4 If MEA07 is present, then at least one of MEA03 MEA05 or MEA06 is required.

5 Only one of MEA08 or MEA03 may be present.

Semantic Notes: 1 MEA04 defines the unit of measure for MEA03, MEA05, and MEA06.

Comments: When citing dimensional tolerances, any measurement requiring a sign (+ or -), or any measurement where a positive (+) value cannot be assumed, use MEA05 as the

negative (-) value and MEA06 as the positive (+) value.

Notes:	This specific PTD loop is required if the account has net metering or is a part of an Aggregated Net Energy Metering (ANEM) Family.							
	The MEA segment is sent for each (to the QTY.	The MEA segment is sent for each QTY loop. The MEA will indicate the "time of use" that applies to the QTY.						
PA Use:	Not Used	Not Used						
NJ Use:	ACE and JCPL Only: Required if the account has net metering							
DE Use:	Not Used							
MD Use:	Required for each QTY

Examples:

General Note:

For the detail portion, you may send your PTD loops in any order; this is a function of ANSI. The indicator in the PTD loop tells what information is contained in the loop. A translator's mapper will map the loop according to your instructions.

Example 1 – One Meter – On/off peak:

Following example is for an account with one meter. Meter multiplier is 2, Power factor is 1.9999, and no transformer loss. The meter measures on and off peak consumption, and the meter readings are at the on / off peak consumption level. The meter also measures on and off peak demand.

- Total consumption is 100 KWH (60 on peak / 40 off-peak). Demand: On peak 4.7, Off peak 4.1 (billed 4.7).
- This example includes the Summary loop which summarizes kWh (and KVARH, if it existed), and the Monthly Billed Summary for billed kWh, kW (and kvarh if relevant).

Pennsylvania Net Metering / Customer Generation Examples ("Bank Rollover") / not FirstEnergy

Scenario is for single meter reading both consumption and generation. Month 1 is net generation applied into 'bank'. Month 2 is net consumption with bank applied to bill but not fully exhausted. Month 3 is net consumption with bank applied to bill and exhausted with remaining consumption billed to customer.

Month 1- Customer net generates 800KH into 'bank', billed KH is zero.

New Jersey (PSE&G) Net Metering / Customer Generation Examples

Net Meter / Customer Generation PSE&G Scenario 1A: Consumption greater than generation

Single meter reporting both in and out flow KH.

Customer consumed 1000KH and generated 200KH.

The billed KH in the BB loop is 800KH.

The net consumption in the SU loop is 800KH.

There is one PM with the QTY looped, one for the consumption KH (1000KH) and another for the generation KH (200) both with same meter number.

BGE Scenario I - TOU net meter account. On Peak excess generation rolls forward. Self-generation applied to Intermediate and Off Peak. Remaining consumption for Intermediate and Off Peak billed. Example for end of year net metering True-Up of excess generation.

Note this is like Scenario G, except the utility cashes out the customer for the year end excess generation.

Current usage amounts in PM loop

Off Peak +800 kWh On Peak -1000 kWh Int Peak +700 kWh

Starting banked amounts (QTY*QH)

Off Peak -200 kWh On Peak -500 kWh Int Peak -200 kWh

Self-generation applied from Starting Bank (QTY*79)

Off Peak -200 kWh On Peak 0 kWh Int Peak -200 kWh

True-up of Excess Generation (QTY*QB)

Off Peak 0 kWh On Peak -1500 kWh Int Peak 0 kWh

Ending banked amounts (QTY*QE)

Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Note 1: For a regular net meter account (non-NMA/ANEM), BGE will only apply generation from an individual peak period to consumption from the same peak period. There will be no cross-peak pollination as done with BGE ANEM TOU accounts. Excess generation will roll forward at the peak level and eventually be cashed out (true-up). Note 2: During True-Up for TOU, if one TOU peak contains excess generation passed in QTY*QB, all TOU peaks must be sent even when 0 kWh. For non-TOU, if there is no excess generation during the True-Up event, the QTY*QB will NOT be sent.

PHI/PE Scenario I - TOU net meter account. On Peak excess generation rolls forward. Self-generation applied to Intermediate and Off Peak. Remaining consumption for Intermediate and Off Peak billed. Example for end of year net metering True-Up of excess generation.

Note this is like Scenario G, except the utility cashes out the customer for the year end excess generation.

Current consumption in PM loop

Off Peak +1600 kWh On Peak +200 kWh Int Peak +1550 kWh

Current generation in PM loop

Off Peak -800 kWh On Peak -1200 kWh Int Peak -850 kWh

Starting banked amounts (QTY*QH)

Off Peak -200 kWh On Peak -500 kWh Int Peak -200 kWh

Self-generation applied from Starting Bank (QTY*79)

Off Peak -200 kWh On Peak = 0 kWh Int Peak -200 kWh

True-up of Excess Generation (QTY*QB)

Off Peak 0 kWh On Peak -1500 kWh Int Peak 0 kWh

Ending banked amounts (QTY*QE)

Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Note 1: For a regular net meter account, the utility will only apply generation from an individual peak period to consumption from the same peak period. Excess generation will roll forward at the peak level and eventually be cashed out (true-up).

Note 2: During True-Up for TOU, if one TOU peak contains excess generation passed in QTY*QB, all TOU peaks must be sent even when 0 kWh. For non-TOU, if there is no excess generation during the True-Up event, the QTY*QB will NOT be sent.

Non-TOU reporting only net kWh (BGE)

Example #6 - Parent Host Net Metered Account, example for end of year net metering True-Up of excess generation. (Showing Parent Host accounts only)

Parent Host Account – April reporting month (Ending bank true up month).

NOTE: During True-Up for TOU, if one TOU peak contains excess generation, the QTY*QB must be sent for all TOU's even when others contain 0 kWh. For non-TOU, if there is no excess generation during the True-Up event, the QTY*QB will NOT be sent.

- Starting Bank = 0 kWh
- Net Generation = 300 kWh
- Self-generation applied from Starting Bank = 0 kWh
- Generation Transferred to Child Account = 200 kWh
- True-Up = 100 kWh
- Ending Bank = 0 kWh

PTD*BB = 0

Maryland (BGE) - Examples of PTD*BJ Loop for Aggregate Net Energy Metering (ANEM), TOU

BGE Scenario A - Host is TOU, Child # 1 is Non-TOU, Child # 2 is TOU. Neither Child is net metered.

Parent Host Account

Starting Banked amounts for Host Off Peak -300 kWh

On Peak -500 kWh Int Peak -400 kWh

Host's current usage for 04/05/16 to 05/04/16

Off Peak -50 kWh On Peak -100 kWh Int Peak -75 kWh

So the host now has the following excess generation to apply to his children:

-350 kWh from Off Peak

-600 kWh from On Peak

-475 kWh from Int Peak

Ending Banked amounts for Host

Off Peak 0 kWh On Peak -325 kWh Int Peak 0 kWh

Child #1 (NON-TOU)

Current usage for 04/05/16 to 05/04/16 is +400 kWh (350 kWh from Host's Off Peak and 50 kWh from Host's Int Peak applied)

Child #2 (TOU)

Current usage for 04/05/16 to 05/04/16

Off Peak +200 kWh (200 kwh from Host's On Peak applied)

On Peak +300 kWh (300 kWh from Host's Int Peak applied)

Int Peak +200 kWh (125 kWh from Host's Int Peak and 75 kWh from Host's On Peak applied)

Notes:

- 4. BGE applies generation from the host using Off Peak first, then Intermediate and lastly On Peak.
- 5. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).

BGE Scenario D - Host is TOU, Child #1 is TOU Net Meter, Child #2 is TOU

Parent Host Account

Starting Banked amounts for Host Off Peak -500 kWh On Peak -1000 kWh Int Peak -800 kWh

Host's current usage for 04/05/16 to 05/04/16 Off Peak -100 kWh On Peak -500 kWh

So the host now has the following excess generation to apply to his children:

-600 kWh from Off Peak

Int Peak -200 kWh

- -1500 kWh from On Peak
- -1000 kWh from Int Peak

Ending Banked amounts for Host Off Peak 0 kWh On Peak -200 kWh Int Peak 0 kWh

Child #1 (TOU- Net Meter)

Starting Banked amounts for Child # 1 Off Peak 0 kWh On Peak -200 kWh Int Peak -100 kWh

Current usage for 04/05/16 to 05/04/16 for Child # 1

Off Peak +100 kWh (100 kwh from Host's Off Peak applied)

On Peak +400 kWh (100 kWh from Child's Int Peak applied, 200 kWh from Child's On Peak applied and 100 kWh from Host's Off Peak applied)

Int Peak +200 kWh (200 kWh from Host's Off Peak applied)

Ending Banked amounts for Child # 1 Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child #2 (TOU)

Current usage for 04/05/16 to 05/04/16

Off Peak +700 kWh (700 kWh from Host's On Peak applied)

On Peak +1000 kWh (200 kWh from Host's Off Peak applied and 800 kWh from Host's Int Peak applied) Int Peak +800 kWh (200 kWh from Host's Int Peak applied and 600 kWh from Host's On Peak applied)

Notes:

- 5. BGE applies generation from the host using Off Peak first, then Intermediate and lastly On Peak.
- 6. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).
- 7. A net metered Child account must first exhaust his own excess generation across all peaks before tapping into the Host's excess generation. A net metered Child will first use any excess generation from his Off peak, then Int Peak and lastly On Peak. This excess generation will be applied first to his On Peak, then Int Peak and lastly Off Peak. Once the Child's excess generation has been exhausted, the Child can receive excess generation from the Host account.

BGE Scenario E - Host Net Meter TOU, Child #1 Net Meter TOU (Child uses his own generation to offset current month's consumption. Child's generation is not exhausted). Child #1 receives nothing from the Host account. Child #2 is Non-TOU and receives generation from the Host.

Parent Host Account

Starting Banked amounts for Host Off Peak -300 kWh On Peak -500 kWh Int Peak -400 kWh

Host's current usage for 04/05/16 to 05/04/16 Off Peak -50 kWh On Peak -100 kWh Int Peak -75 kWh

So the host now has the following excess generation to apply to his children:

-350 kWh from Off Peak

-600 kWh from On Peak

-475 kWh from Int Peak

Ending Banked amounts for Host Off Peak 0 kWh On Peak -600 kWh Int Peak -425 kWh

Child #1 (TOU- Net Meter)

Starting Banked amounts for Child # 1 Off Peak 0 kWh On Peak -2000 kWh Int Peak -100 kWh

Current usage for 04/05/16 to 05/04/16 for Child # 1
Off Peak +1000 kWh (1000 kwh from Child's On Peak applied)
On Peak +400 kWh (100 kWh from Child's Int Peak applied, 300 kWh from Child's On Peak applied)
Int Peak +200 kWh (200 kWh from Child's On Peak applied)

Ending Banked amounts for Child # 1 Off Peak 0 kWh On Peak 500 kWh Int Peak 0 kWh

Child #2 (Non-TOU)

Current usage for 04/05/16 to 05/04/16 is +400 kWh (350 kWh from Host's Off Peak and 50 kWh from Host's Int Peak applied).

Notes:

- 1. BGE applies generation from the host using Off Peak first, then Intermediate and lastly On Peak.
- 2. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).
- 3. A net metered Child account must first exhaust his own excess generation across all peaks before tapping into the Host's excess generation. A net metered Child will first use any excess generation from his Off peak, then Int Peak and lastly On Peak. This excess generation will be applied first to his On Peak, then Int Peak and lastly Off Peak. Once the Child's excess generation has been exhausted, the Child can receive excess generation from the Host account.

BGE Scenario F - Host TOU, Child is TOU and Net Meter. Child applies his own generation to himself first, then receives the remaining available generation from the Host. Child has consumption left over after generation from Host and Child applied to current month's usage.

Parent Host Account

Starting Banked amounts for Host Off Peak -0 kWh On Peak -4900 kWh Int Peak -0 kWh

Host's current usage for 04/05/16 to 05/04/16 Off Peak +500 kWh On Peak +1000 kWh Int Peak +2000 kWh

Host applied 4900 kWh excess generation from On Peak to: 1000 kWh from On Peak, 2000 kWh from Intermediate Peak and lastly to 500 kWh from Off Peak using up 3500 kWh of generation. This leaves 1400 kWh generation from On Peak to apply to his child. Host applied 1100 kWh to Child's On Peak and then 300 kWh to Child's Intermediate Peak. Host has no remaining banked amount in any peak period.

Ending Banked amounts for Host Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child (TOU- Net Meter)

Starting Banked amounts for Child Off Peak 0 kWh On Peak -200 kWh Int Peak -100 kWh

Current usage for 04/05/16 to 05/04/16 for Child

Off Peak +1000 kWh (Nothing applied from either Child or Host leaving 1000 kwh to be billed)

On Peak +1400 kWh (100 kWh from Child's Int Peak applied, 200 kWh from Child's On Peak applied, 1100 kWh from Host's On Peak applied)

Int Peak +1200 kWh (300 kWh from Host's On Peak applied, leaving 900 kWh to be billed)

Child has 1900 kWh left to bill at the peak level below.

Off Peak = 1000On Peak = 0Int Peak = 900

Ending Banked amounts for Child Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Notes:

- 1. BGE applies generation <u>from the host</u> using Off Peak first, then Intermediate and lastly On Peak.
- 2. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).
- 3. A net metered Child account must first exhaust his own excess generation across all peaks before tapping into the Host's excess generation. A net metered Child will first use any excess generation from his Off peak, then Int Peak and lastly On Peak. This excess generation will be applied first to his On Peak, then Int Peak and lastly Off Peak. Once the Child's excess generation has been exhausted, the Child can receive excess generation from the Host account.

BGE Scenario G - Host is TOU, Child # 1 is TOU Net Meter, Child # 2 is TOU. April True-up month. Host has excess generation after the April billing and needs a True-up. Child #1 does not have any excess generation left so there is no True-up. Please note: Since Child #1 does not need a True-up, we will not send the Qty*QB section in the BJ loop.

Parent Host Account

Starting Banked amounts for Host Off Peak -500 kWh On Peak -1000 kWh Int Peak -800 kWh

Host's current usage for 03/05/16 to 04/04/16

Off Peak -100 kWh On Peak -500 kWh Int Peak -200 kWh

So the host now has the following excess generation to apply to his children:

- -600 kWh from Off Peak
- -1500 kWh from On Peak
- -1000 kWh from Int Peak

True-Up amounts for Host (cashed out to customer) Off Peak 0 kWh On Peak 200 kWh Int Peak 0 kWh

Ending Banked amounts for Host Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child #1 (TOU- Net Meter)

Starting Banked amounts for Child # 1 Off Peak 0 kWh On Peak -200 kWh Int Peak -100 kWh

Current usage for 03/05/16 to 04/04/16 for Child # 1

Off Peak +100 kWh (100 kwh from Host's Off Peak applied)

On Peak +400 kWh (100 kWh from Child's Int Peak applied, 200 kWh from Child's On Peak applied and 100 kWh from Host's Off Peak applied)

Int Peak +200 kWh (200 kWh from Host's Off Peak applied)

Ending Banked amounts for Child # 1 Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child #2 (TOU)

Current usage for 03/05/16 to 04/04/16

Off Peak +700 kWh (700 kWh from Host's On Peak applied)

On Peak +1000 kWh (200 kWh from Host's Off Peak applied and 800 kWh from Host's Int Peak applied) Int Peak +800 kWh (200 kWh from Host's Int Peak applied and 600 kWh from Host's On Peak applied)

Notes:

1. BGE applies generation from the host using Off Peak first, then Intermediate and lastly On Peak.

- 2. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).
- 3. A net metered Child account must first exhaust his own excess generation across all peaks before tapping into the Host's excess generation. A net metered Child will first use any excess generation from his Off peak, then Int Peak and lastly On Peak. This excess generation will be applied first to his On Peak, then Int Peak and lastly Off Peak. Once the Child's excess generation has been exhausted, the Child can receive excess generation from the Host account.
- 4. During True-Up for TOU, if one TOU peak contains excess generation passed in QTY*QB, all TOU peaks must be sent even when 0 kWh.

BGE Scenario H - Host is TOU, Child # 1 is TOU Net Meter, Child # 2 is TOU. April True-up month. Both Host and Child have excess generation after the April billing and need a True-up.

Parent Host Account

Starting Banked amounts for Host Off Peak -500 kWh On Peak -1000 kWh Int Peak -800 kWh

Host's current usage for 03/05/16 to 04/04/16 Off Peak -100 kWh On Peak -500 kWh

Int Peak -200 kWh

So the host now has the following excess generation to apply to his children:

- -600 kWh from Off Peak
- -1500 kWh from On Peak
- -1000 kWh from Int Peak

True-Up amounts for Host (cashed out to customer) Off Peak 0 kWh On Peak 600 kWh Int Peak 0 kWh

Ending Banked amounts for Host Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child #1 (TOU- Net Meter)

Starting Banked amounts for Child # 1 Off Peak 0 kWh On Peak -1200 kWh Int Peak -100 kWh

Current usage for 03/05/16 to 04/04/16 for Child # 1
Off Peak +100 kWh (100 kwh from Child's On Peak applied)
On Peak +400 kWh (100 kWh from Child's Int Peak applied, 300 kWh from Child's On Peak applied)
Int Peak +200 kWh (200 kWh from Child's On Peak applied)

True-Up amounts for Child#1 (cashed out to customer) Off Peak 0 kWh On Peak 600 kWh Int Peak 0 kWh Ending Banked amounts for Child # 1 Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Child #2 (TOU)

Current usage for 03/05/16 to 04/04/16

Off Peak +700 kWh (700 kWh from Host's On Peak applied)

On Peak +1000 kWh (600 kWh from Host's Off Peak applied and 400 kWh from Host's Int Peak applied) Int Peak +800 kWh (600 kWh from Host's Int Peak applied and 200 kWh from Host's On Peak applied)

Notes:

- 1. BGE applies generation from the host using Off Peak first, then Intermediate and lastly On Peak.
- 2. BGE applies generation to a child in the opposite order (On Peak first, then Intermediate and lastly Off Peak).
- 3. A net metered Child account must first exhaust his own excess generation across all peaks before tapping into the Host's excess generation. A net metered Child will first use any excess generation from his Off peak, then Int Peak and lastly On Peak. This excess generation will be applied first to his On Peak, then Int Peak and lastly Off Peak. Once the Child's excess generation has been exhausted, the Child can receive excess generation from the Host account.
- 4. During True-Up for TOU, if one TOU peak contains excess generation passed in QTY*QB, all TOU peaks must be sent even when 0 kWh.

Maryland (PHI/PE) - Examples of PTD*BJ Loop for Aggregate Net Energy Metering (ANEM), TOU

PHI/PE Scenario A - Host is TOU, Child #1 is Non-TOU, Child #2 is TOU

Parent Host Account

Starting Bank = -1200 kWh Off Peak -300 kWh

On Peak -500 kWh

Int Peak -400 kWh

Current usage for 04/05/16 to 05/04/16 = -225 kWh, 0 kWh Billed

Off Peak -50 kWh

On Peak -100 kWh

Int Peak -75 kWh

Excess generation for family = -1425 kWh

- -350 kWh from Off Peak
- -600 kWh from On Peak
- -475 kWh from Int Peak

Transferred Out = -1000 kWh

- -200 kWh from Off Peak
- -600 kWh from On Peak
- -200 kWh from Int Peak

Ending Bank = -425 kWh

Off Peak -150 kWh

On Peak 0 kWh

Int Peak -275 kWh

Child #1 (NON-TOU)

Current usage for 04/05/16 to 05/04/16 is 400 kWh, -400 kWh applied from ParentHost's On Peak = 0 kWh billed

Child #2 (TOU)

Current usage for 04/05/16 to 05/04/16 = 100 kWh billed

Off Peak +200 kWh (200 kwh from ParentHost's Off Peak applied) = 0 kWh

On Peak +300 kWh (200 kWh from ParentHost's On Peak applied) = 100 kWh billed

Int Peak +200 kWh (200 kWh from ParentHost's Int Peak applied) = 0 kWh

Notes:

- 1. Applies TOU generation using the "waterfall" method. Off Peak to Off Peak, On Peak & Intermediate Peak to Intermediate Peak.
- 2. When applying TOU excess generation to a non-TOU account will use the On Peak energy first, followed by the Intermediate Peak and finally the Off-Peak.

PHI/PE Scenario B - Host is TOU, Child # 1 is TOU, Child # 2 is Non-TOU Parent Host Account

Starting Bank = -1200 kWh Off Peak -300 kWh On Peak -500 kWh Int Peak -400 kWh

Current usage for 04/05/16 to 05/04/16 = -225 kWh, 0 kWh Billed

Off Peak -50 kWh On Peak -100 kWh Int Peak -75 kWh

Excess generation for family = -1425 kWh

- -350 kWh from Off Peak
- -600 kWh from On Peak
- -475 kWh from Int Peak

Transferred Out = -1100 kWh

- -200 kWh from Off Peak
- -600 kWh from On Peak
- -300 kWh from Int Peak

Ending Bank = -325 kWh Off Peak -150 kWh On Peak 0 kWh Int Peak -175 kWh

Child #1 (TOU)

Current usage for 04/05/16 to 05/04/16, 700 kWh, -700 kWh applied from ParentHost's On Peak = 0 kWh billed Off Peak +200 kWh (200 kwh from ParentHost's Off Peak applied) = 0 kWh On Peak +300 kWh (300 kWh from ParentHost's On Peak applied) = 0 kWh Int Peak +200 kWh (200 kWh from ParentHost's Int Peak applied) = 0 kWh

Child #2 (NON-TOU)

Current usage for 04/05/16 to 05/04/16 is +400 kWh (300 kWh from ParentHost's On Peak and 100 kWh from ParentHost's Int Peak applied)

Notes:

- 1. Applies TOU generation using the "waterfall" method. Off Peak to Off Peak, On Peak & Intermediate Peak to Intermediate Peak.
- 2. When applying TOU excess generation to a non-TOU account PHI will use the On Peak energy first, followed by the Intermediate Peak and finally the Off-Peak.

PHI Scenario E - ParentHost is TOU, Parent is TOU, Child is TOU (only PHI uses Parent accounts)

Parent Host Account

Starting Bank = -2300 kWh Off Peak -500 kWh On Peak -1000 kWh Int Peak -800 kWh

Current usage for 04/05/16 to 05/04/16 = -1800 kWh, 0 kWh Billed

Off Peak -100 kWh On Peak -1500 kWh Int Peak -200 kWh

Transferred In (from Parent) = -800 kWh

- -100 kWh from Off Peak
- -500 kWh from On Peak
- -200 kWh from Int Peak

Excess generation for family = -4900 kWh (sum of Starting Bank, Current Period Excess & transferred in from Parent)

- -700 kWh from Off Peak
- -3000 kWh from On Peak
- -1200 kWh from Int Peak

Transferred Out = -2500 kWh

- -700 kWh from Off Peak
- -1000 kWh from On Peak
- -800 kWh from Int Peak

Ending Bank = -2400 kWh Off Peak 0 kWh On Peak -2000 kWh Int Peak -400 kWh

Parent Account TOU w/Net Meter (does not utilize starting or ending bank, all excess transfers out to ParentHost)

Current usage for 04/05/16 to 05/04/16 = -800 kWh, 0 kWh Billed Off Peak -100 kWh

On Peak -500 kWh Int Peak -200 kWh

IIIt I Cak -200 KWII

Transferred Out (to ParentHost into Generation available for family) = -800 kWh

- -100 kWh from Off Peak
- -500 kWh from On Peak
- -200 kWh from Int Peak

Child #1 (TOU)

Current usage for 04/05/16 to 05/04/16, 2600 kWh, -2500 kWh applied from ParentHost = 100 kWh billed Off Peak +800 kWh (700 kWh from Host's Off Peak applied) = 100 kWh billed On Peak +1000 kWh (1000 kWh from Host's On Peak applied) = 0 kWh Int Peak +800 kWh (800 kWh from Host's Int Peak applied) = 0 kWh

Notes:

1. Applies TOU generation using the "waterfall" method. Off Peak to Off Peak, On Peak & Intermediate Peak to Intermediate Peak.

2. For TOU Parent, excess generation from an individual peak period transfers to ParentHost's available generation.

PHI Scenario F - ParentHost is TOU, Parent #1 is TOU, Parent #2 is non-TOU, Child #1 is TOU, Child #2 is non-TOU (only PHI uses Parent accounts)

Parent Host Account

Starting Bank = -2300 kWh Off Peak -500 kWh On Peak -1000 kWh Int Peak -800 kWh

Current usage for 04/05/16 to 05/04/16 = -800 kWh, 0 kWh Billed

Off Peak -100 kWh On Peak -1500 kWh Int Peak -200 kWh

Transferred In (from Parent #1 & Parent #2) = -1000 kWh

- -800 kWh from Off Peak (from Parent #2)
- -200 kWh from On Peak (from Parent #1)

0 kWh from Int Peak

Excess generation for family = -5100 kWh (sum of Starting Bank, Current Period Excess & transferred in from Parent)

- -1400 kWh from Off Peak
- -2700 kWh from On Peak
- -1000 kWh from Int Peak

Transferred Out = -5100 kWh

- -1400 kWh from Off Peak
- -2700 kWh from On Peak
- -1000 kWh from Int Peak

Ending Bank = 0 kWh Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Parent Account #1: TOU w/Net Meter (does not utilize starting or ending bank, all excess transfers out to ParentHost)

Current usage for 04/05/16 to 05/04/16 = 300 kWh, -300 applied from ParentHost, -200 transferred out = 0 kWh billed

Off Peak +100 kWh (100 kWh from Host's Off Peak applied) = 0 kWh

On Peak -200 kWh (200 kWh transferred out to Host, see below) = 0 kWh

Int Peak +200 kWh (200 kWh from Host's Int Peak applied) = 0 kWh

Transferred Out (to ParentHost into Generation available for family) = -200 kWh

0 kWh from Off Peak

-200 kWh from On Peak

0 kWh from Int Peak

Parent Account #2: non-TOU w/Net Meter (does not utilize starting or ending bank, all excess transfers out to ParentHost)

Current usage for 04/05/16 to 05/04/16 = -800 kWh, 0 kWh Billed

-800 kWh

Transferred Out (to ParentHost into Generation available for family) = -800 kWh

-800 kWh

Child #1 (TOU)

Current usage for 04/05/16 to 05/04/16, 2600 kWh, -2600 kWh applied from ParentHost = 0 kWh billed

Off Peak +800 kWh (800 kWh from Host's Off Peak applied) = 0 kWh On Peak +1000 kWh (1000 kWh from Host's On Peak applied) = 0 kWh Int Peak +800 kWh (800 kWh from Host's Int Peak applied) = 0 kWh

Child #2 (NON-TOU)

Current usage for 04/05/16 to 05/04/16 is 4000 kWh, -1700 kWh applied from ParentHost's On Peak, 0 kWh applied from ParentHost's Int Peak, -500 kWh applied from ParentHost's Off Peak = 1800 kWh billed

Notes:

- 1. Applies TOU generation using the "waterfall" method. Off Peak to Off Peak, On Peak & Intermediate Peak to Intermediate Peak.
- 2. For TOU Parent, excess generation from an individual peak period transfers to ParentHost's individual peak
- 3. For non-TOU Parent, excess generation transfers to TOU ParentHost's Off Peak level
- 4. When applying TOU excess generation to a non-TOU account will use the On Peak energy first, followed by the Intermediate Peak and finally the Off-Peak.

PHI/PE Scenario G - ParentHost True-up Event. Host has excess generation and needs a True-up. (Showing ParentHost accounts only)

Parent Host Account - True Up Event

Starting Bank = -1200 kWh

Off Peak -300 kWh

On Peak -500 kWh

Int Peak -400 kWh

Current usage for 04/05/16 to 05/04/16 = -225 kWh, 0 kWh Billed

Off Peak -50 kWh

On Peak -100 kWh

Int Peak -75 kWh

Excess generation for family = -1425 kWh

- -350 kWh from Off Peak
- -600 kWh from On Peak
- -475 kWh from Int Peak

Transferred Out = -700 kWh

- -200 kWh from Off Peak
- -300 kWh from On Peak
- -200 kWh from Int Peak

True-Up amounts for Host (cashed out to customer) = -725 kWh

Off Peak -150 kWh

On Peak -300 kWh

Int Peak -275 kWh

Ending Bank = 0 kWh Off Peak 0 kWh On Peak 0 kWh Int Peak 0 kWh

Notes:

- 1. Applies TOU generation using the "waterfall" method. Off Peak to Off Peak, On Peak & Intermediate Peak to Intermediate Peak.
- 2. For TOU Parent, excess generation from an individual peak period transfers to ParentHost's available generation.
- 3. During True-Up for TOU, if one TOU peak contains excess generation passed in QTY*QB, all TOU peaks must be sent even when 0 kWh.
- 4. During True-Up event, if there is nothing to True-up, the QTY*QB will NOT be sent.

Maryland SCB Example - 2: Single Meter On/Off Peak

Following example is for an account with one meter. Meter multiplier is 1, Power factor is 1.9999, and no transformer loss. The meter measures on and off-peak consumption, and the meter readings are at the on / off peak consumption level. The meter also measures on and off-peak demand. The assumption here is that the Meter Multiplier and the Power factor are not currently being passed in the PM loop, so they are included in the BP loop for inclusion on the bill.

- •Total consumption is 100 KWH (60 on peak / 40 off-peak). Demand: On peak 4.7, Off peak 4.1 (billed 4.7).
- •This example includes the Summary loop which summarizes kWh (and KVARH, if it existed), and the Monthly Billed Summary for billed kWh, kW (and kvarh if relevant).

This example demonstrates adding the MU and ZA information when missing from the PM loops or equal to 1.0.

	ZA information when missing from the PW loops of equal to 1.0.

<u>Maryland SCB Example – 3: Multiple Unmetered Services</u>

PHI Unmetered Street Lighting for multiple device types. Unmetered consumption is 15,689 kh across 380 unmetered devices representing 5 unmetered device types.

This example shows the individual unmetered device detail added to the BP loops. Detail about each group of unmetered devices is required to be passed to provide the level of detail currently printed on customer bills by PE and PHI. The total unmetered consumption will be passed in the BC loop as is done today.

The Meter Number - REF*MG*UNMETERED is defaulted to UNMETERED so that the required segments needed to pass the unmetered account detail in the BP loop can be identified as they are different than the PM loop content

Maryland SCB Example - 7: PE Community Solar Child Account

No Self Generation on the Child Account

Allocation of 16,651 kwh from the Host Account

Starting Child Bank QTY*QH = 0

Child Self Generation QTY*79 = 0

Child Ending Bank QTY*QE = 0

Generation transferred from Host to Child account QTY*77 = 16,650

The REF*AN Segment (in the PTM*BJ – QTY*77 Loop) provides the name of the community Solar program

The following example is for a PE CHILD, Community Solar account that has consumption of 21,120 kwh. The Child account does not have self-generation, but receives an allocation of from the community solar host account of 16,651 kwh resulting in billed usage of 4,469 kwh,

This example demonstrates adding the MU and ZA information when missing from the PM loops or equal to 1.0.

Program.	

Maryland SCB Example - 8: PE Community Solar Child Account

No Self Generation on the Child Account

Allocation of 16,651 kwh from the Host Account – From two Community Solar Programs

Starting Child Bank QTY*QH = 0

Child Self Generation QTY*79 = 0

Child Ending Bank QTY*QE = 0

Generation transferred from Host to Child account QTY*77 = 10,000 – Community Solar Program 1.

Generation transferred from Host to Child account QTY*77 = 6,651 – Community Solar Program 2.

The REF*AN Segment, in the PTM*BP Loop, provides the name of the Community Solar Programs.

The following example is for a PE CHILD, Community Solar account that has consumption of 21,120 kwh. The Child account does not have self-generation, but receives an allocation of from the community solar host account of 16,651 kwh resulting in billed usage of 4,469 kwh,

This example demonstrates adding the MU and ZA information when missing from the PM loops or equal to 1.0.
