SUBJECT: TCP - ANISOLE STRIPPING AND AUTOCLAVE CONDITIONS - REPORT I

The recent change in Autoclave conditions from temperature averages of about 185 °C. to lower temperatures (160-165 °C.) has increased the 2,4,5-TCP assay of the finished product. The chart below shows some of the assays which have been run.

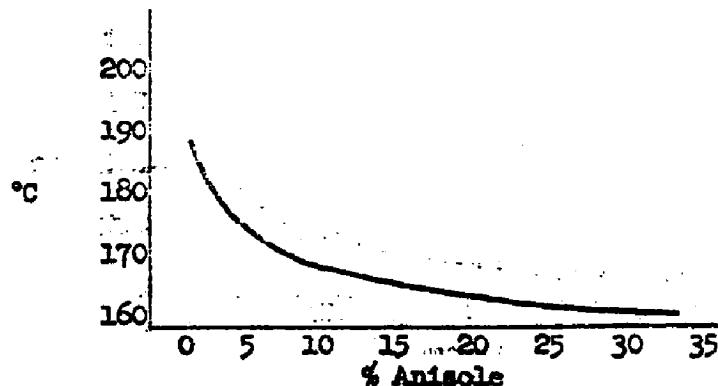

| <u>Autoclave Temperature</u> | <u>% 2,4,5-TCP</u> |
|------------------------------|--------------------|
| 185 °C | 83.7 |
| 183 | 81.5 |
| 185 | 84.6 |
| 160 | 91.8 |
| 162 | 92.3 |
| 165 | 94.5 |
| 163 | 93.2 |
| 165 | 92.4 |

The change in conditions has also resulted in an increase in by-product anisole, thereby decreasing the capacity of both Autoclaves and anisole still. The chart below shows the approximate amount of anisole left in the reaction mixture at various temperatures.

| <u>Autoclave Temperature</u> | <u>% Anisole</u> |
|------------------------------|------------------|
| 185 °C | 1 |
| 165 | 15 |
| 163 | 26 |
| 160 | 33 |

These numbers are better illustrated in Figure 1. following.

The curve shown in Figure 1 may be drawn several ways until more data is obtained; however, it suggests that the reaction at 170°C should be investigated.

It has also been established that increasing the digestion time from five to six to ten hours at 160°C does not significantly lower the amount of recycle amine. This was not checked at 165°C, but will be considered in the future runs. Depending on the quality of product obtained at 170°C, digestion time will be studied at 170°C or 165°C, that is the highest temperature at which good quality SCP can be produced.

The stripping as a function of time was measured on two runs. The data from these runs is shown in the following tables.

| | | |
|------|------------------|-----------------|
| 1330 | 1 hr., 45 mins. | 5 hrs., 5 mins. |
| 1331 | 2 hrs., 35 mins. | 5 hrs., 0 mins. |
| 1332 | 1 hr., 55 mins. | 5 hrs., 0 mins. |
| 1333 | 1 hr., 30 mins. | 5 hrs., 0 mins. |
| 1334 | 1 hr., 45 mins. | 5 hrs., 0 mins. |
| 1335 | 2 hrs., 15 mins. | 5 hrs., 0 mins. |

| | |
|------------------|---|
| 24 hours | 5 |
| 48 hours | 2 |
| Final (72 hours) | 1 |

| | | |
|------|-----------------|-----------------|
| 1336 | 3 hr., 30 mins. | 5 hrs., 0 mins. |
| 1337 | 1 hr., 40 mins. | 5 hrs., 0 mins. |
| 1338 | 1 hr., 40 mins. | 4 hrs., 0 mins. |
| 1339 | 1 hr., 45 mins. | 4 hrs., 0 mins. |
| 1340 | 1 hr., 30 mins. | 4 hrs., 0 mins. |

| | |
|------------------|---|
| 24 hours | 3 |
| Final (48 hours) | 1 |

The curve shown in Figure 1 may be drawn several ways until more data is obtained; however, it suggests that the reaction at 170°C should be investigated.

It has also been established that increasing the digestion time from five to six to ten hours at 160°C does not significantly lower the amount of recycle anisole. This was not checked at 165°C, but will be considered in the future runs. Depending on the quality of product obtained at 170°C, digestion time will be studied at 170°C or 165°C, that is the highest temperature at which good quality TCP can be produced.

The stripping as a function of time was measured on two runs. The data from these runs is shown in the following tables.

RUN #1 - 165°C

| <u>Batch No.</u> | <u>Reaction Time</u> | <u>Digestion Time</u> |
|------------------|----------------------|-----------------------|
| 1330 | 1 hr., 45 mins. | 5 hrs., 5 mins. |
| 1331 | 2 hrs., 35 mins. | 5 hrs., 0 mins. |
| 1332 | 1 hr., 55 mins. | 5 hrs., 0 mins. |
| 1333 | 1 hr., 30 mins. | 5 hrs., 0 mins. |
| 1334 | 1 hr., 45 mins. | 5 hrs., 0 mins. |
| 1335 | 2 hrs., 15 mins. | 5 hrs., 0 mins. |

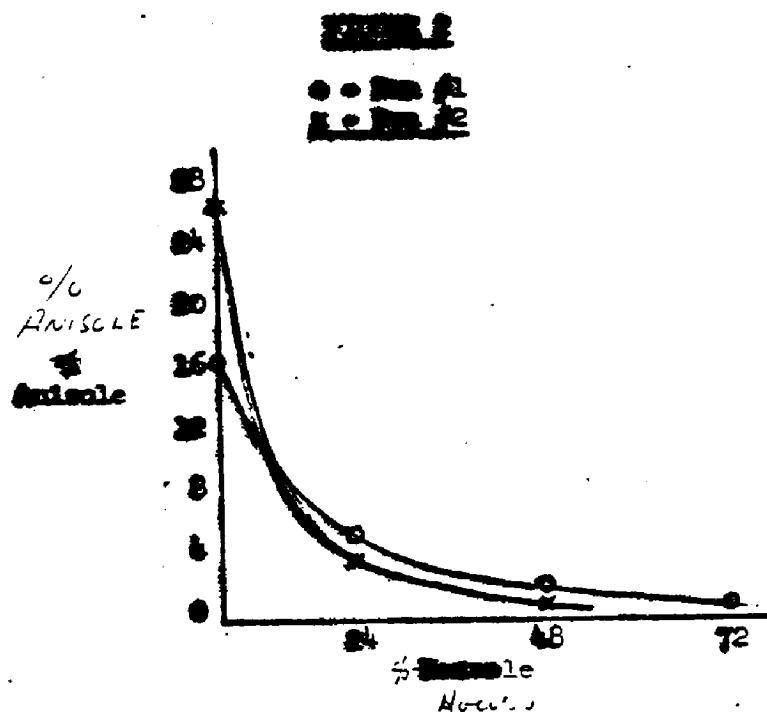

| <u>Sample From Still</u> | <u>% Anisole</u> |
|--------------------------|------------------|
| Original | 16 |
| 24 hours | 5 |
| 48 hours | 2 |
| Final (72 hours) | 1 |

RUN #2 - 163°C

| <u>Batch No.</u> | <u>Reaction Time</u> | <u>Digestion Time</u> |
|------------------|----------------------|-----------------------|
| 1336 | 1 hr., 40 mins. | 5 hrs., 0 mins. |
| 1337 | 1 hr., 40 mins. | 5 hrs., 0 mins. |
| 1338 | 1 hr., 40 mins. | 4 hrs., 0 mins. |
| 1339 | 1 hr., 45 mins. | 4 hrs., 0 mins. |
| 1340 | 1 hr., 50 mins. | 4 hrs., 0 mins. |

| <u>Sample From Still</u> | <u>% Anisole</u> |
|--------------------------|------------------|
| Original | 26 |
| 24 hours | 3 |
| Final (48 hours) | 1 |

Figure 2 illustrates the starting as a function of time, demonstrating, however, that there are many variables associated with the skill.

It is now planned to investigate the reaction at 170°C. Should the quality remain good, then the digestion period will be varied to study the effect on Anisole.
