

***Moving Towards an Improved Delaware
Release Policy for June 1 , 2011
Implementation***

***Peter Kolesar
James Serio***

***Presented to RFAC
March, 8 2011***

This is a partial report on work in process, some which was carried out in response to information received just prior to the RFAC meeting of March 8, 2001. As such it is preliminary.

•

Our Goal for Today

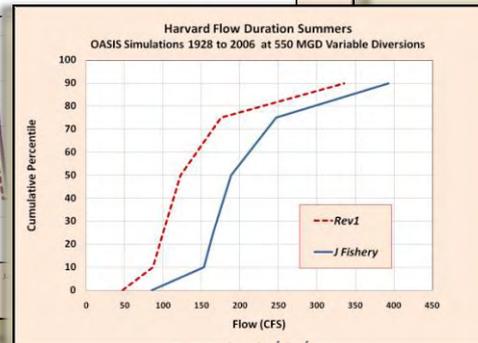

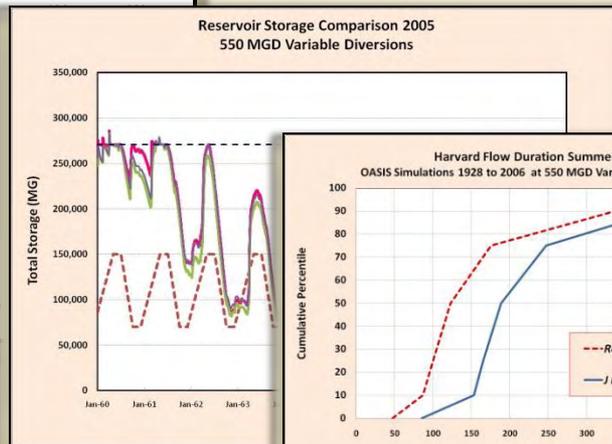

- To encourage the Decree Parties to adopt a release program based on the recommendation in the joint PA/NY fisheries 'White Paper' when the FFMP expires on May 31.
- To dissuade the Decree Parties from reverting to Revision 1 which would be disastrous for the upper river ecology - and indeed be a disservice to all stakeholders --save perhaps New York City.

Background: How We Evaluate Release Policies

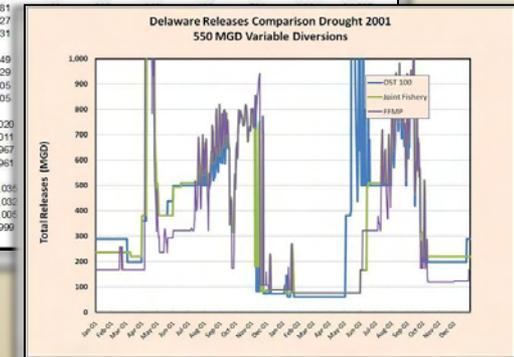

(Using the OASIS and DSS Models)

- Carry out OASIS and DSS analyses under a range of seasonally varying diversion scenarios, typically from 450 to 800 mgd. (98 runs to date.)
- Compute long run performance statistics (1928 to 2006) on storage levels, releases, flows, spills, reservoir refill, drought days and aquatic habitat.
- Focus on critical or 'interesting' time frames: 1960s drought, 2001 drought, the 1990s , summer 2005, recent years, etc. For such time frames do time-plots of important metrics.

And details matter: JFish handles the drought of the century

Linking Releases to Anticipated Diversions

(Our Augmented Adaptive Release Principle)

- We have estimated that J Fish is drought day neutral at about 660 mgd. (In the White Paper, the PA NY Fisheries task force simulated it at 658 mgd.)
- Historical NYC diversions over the last decade
 - Have averaged 512 MGD
 - The year-to-date average diversions, computed each month has been between 377 and 676 mgd, and the 90% percentile was 607 mgd.
- Annual diversions can be forecasted statistically using the forecasting methodology (Hirsh technique) being incorporated into the NYC OST system.

An Implementation Recommendation for June 1

(A very simple switching rule)

- Each month [quarter] NYC will statistically forecast diversions for the year ahead (in say mgd).
- Given a substantive reason and in good faith, NYC may make a judgment-based modification of the above statistical forecast.
- The forecast shall guide the specification of the release table to employ for the coming month [quarter] as follows:
 - If the forecast for the year ahead is 650 mgd or less, use the Joint Fishery Matrix.
 - If the forecast is between 650 and 765 mgd use the current FFMP 35 mgd table.
 - If the forecast is above 765 mgd use the current FFMP 0 mgd table.

Part II. Improving on the Joint Fishery Recommendation

***(It is an improvement , but we can do
even better)***

The Serio Kolesar Enhanced JFish

- We base our recommendations on over 100 OASIS & DSS simulations of release polices and regression analyses done since January.
- Starting from the Joint Fishery recommendation (scenario 6) as our foundation, we arrived at the following modifications:
 - Increased most L2 releases as indicated by our regression model to maximize summer adult trout habitat without violating the drought day constraint.
 - Decreased most L3 and L4 releases, similar to the new OST approach to speed recovery to L2 conditions.
 - Reduced the IERQ to 9,423 cfs days -- similar to the new OST approach.
 - Kept L5 releases at the Joint Fishery recommendations to protect the ecology in severe drought

The Serio Kolesar Enhanced JFish

Comparative Performance in Drought (Storage)

Comparative Performance in Drought (Releases)

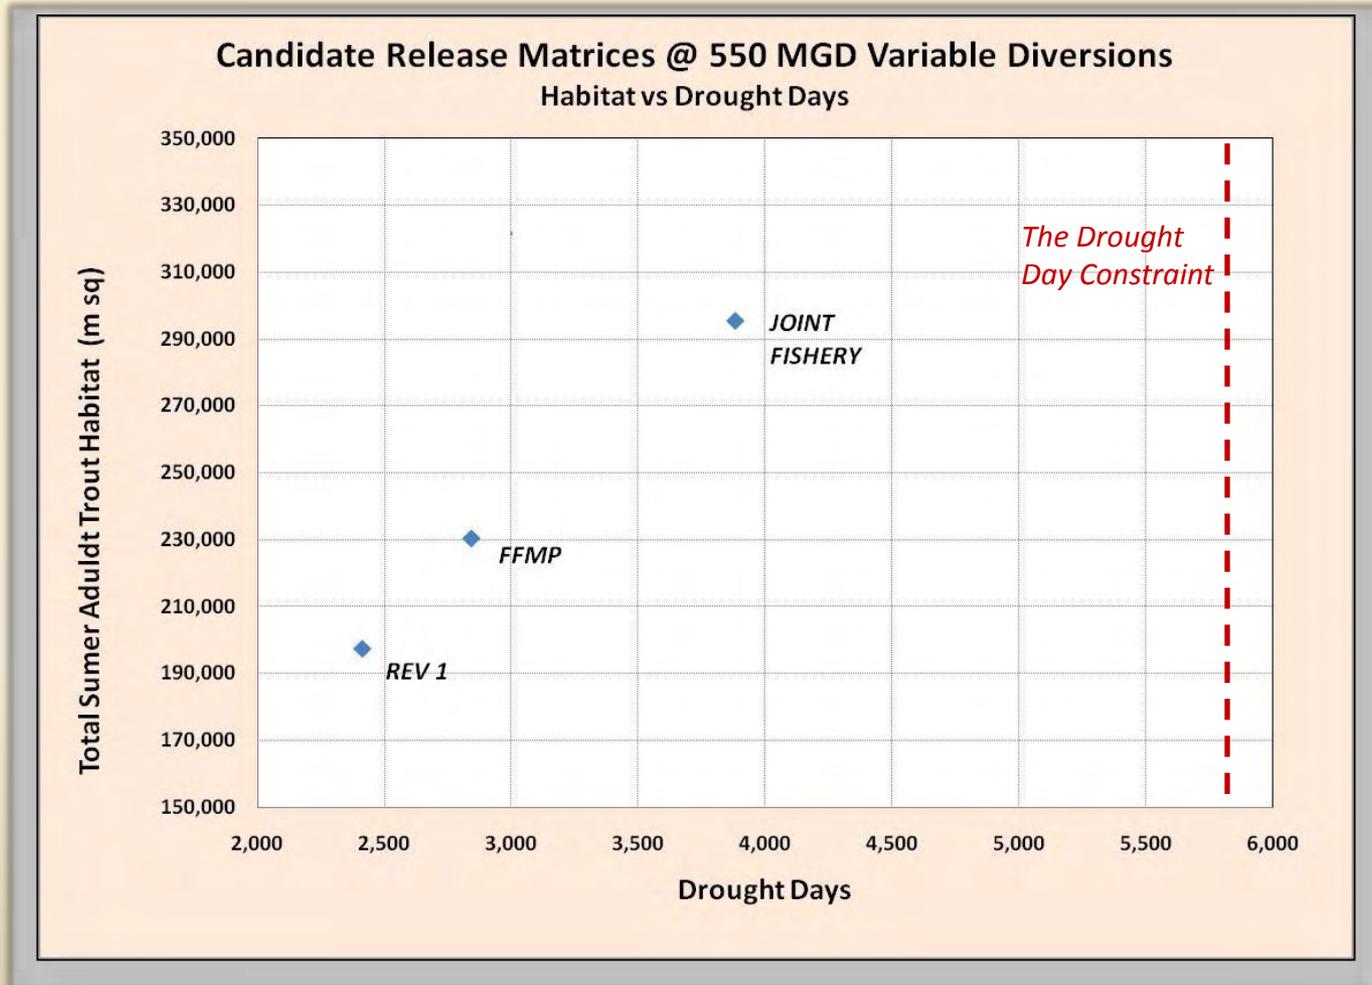

***Part III. Negative Implications of a
Return to Revision 1***

The Bottom Line

- By every measure that matters to the fishing community, reverting to Revision 1 would be an unmitigated disaster!
- In addition, Revision 1 would also be worse for both New Jersey and Pennsylvania and the 'Flood Groups' interests.
- Revision 1 would, however provide some benefit to New York City. It would increase reservoir storage almost uniformly and make any program of water diversion to the City more, rather than less, feasible. It would in no way inhibit the implementation of the OST.

Rev 1 will needlessly save drought days while devastating the fishery.

“Reward”

“Risk”

An Overview Long-run Average Performance (1928 to 2006)

	Rev 1	FFMP	J Fishery
Storage Jun 1	261,554	259,173	255,871
Storage Sep 1	208,815	217,477	208,398
Spills Mean	401	286	239
Upper Drought Watch	458	692	952
Upper Drought Warning	568	672	1,175
Upper Drought Emergency	1,389	1,480	1,757
Upper Drought Total	2,415	2,844	3,884
Lower Drought Total	1,364	1,216	1,156
Reservoir Refill Years	64	61	55
95% Reservoir Refill Years	70	66	66
Summer Adult Trout Habitat (m sq)			
West Branch	53,482	64,586	88,795
East Branch	75,721	89,261	85,468
Neversink	39,939	50,252	50,661
Main Stem	28,267	26,249	70,447
Total Habitat	197,409	230,348	295,371

Some Implications of Reverting to Rev 1 as Compared to the Joint Fishery Recommendation

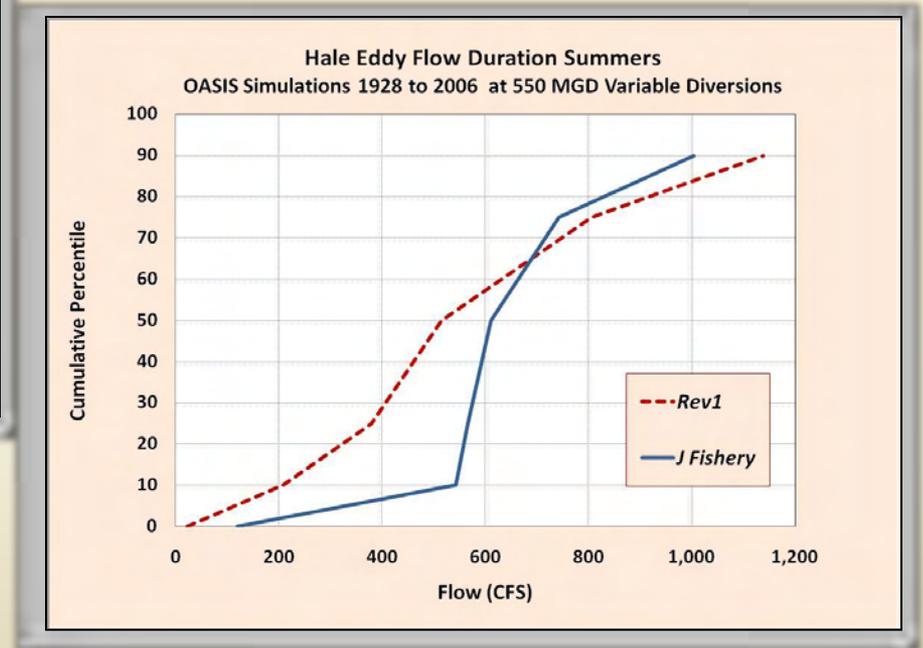

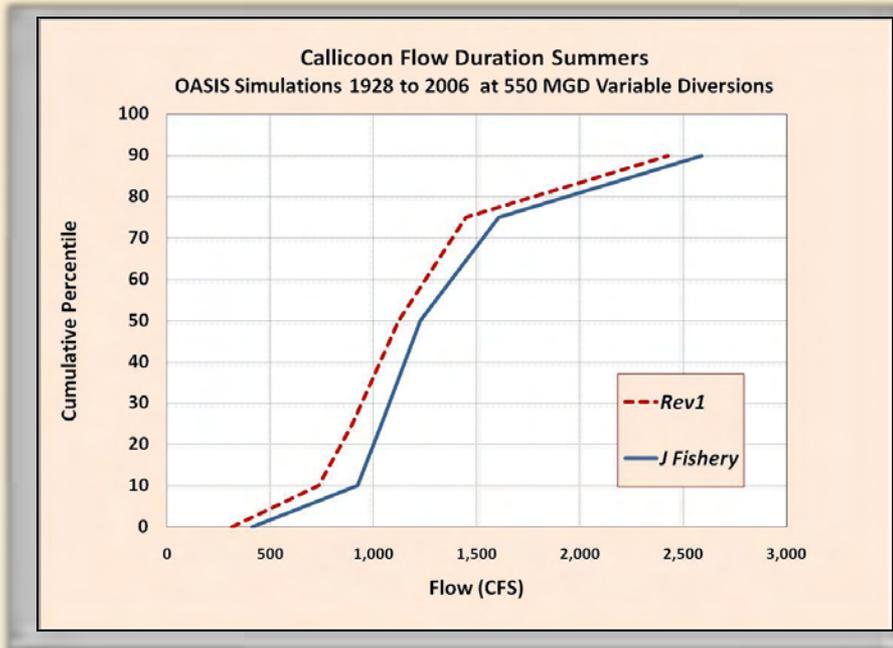

- ***A Fishery Perspective***
 - *Adult trout summer habitat would decrease by 33% overall and 60% in the main stem.*
- ***A Flooding Perspective***
 - *Spilling would increase by 68% and September 1 reservoir voids would go down by 1%.*
- ***A New Jersey Pennsylvania Perspective***
 - *New Jersey diversions would be 1% lower. Trenton median flows would decrease by 6% and 10th percentile flows would decrease by 2%.*
- ***A New York City Perspective***
 - *Average reservoir levels would be 7% higher, June 1 reservoir levels would be 2% higher and reservoirs would refill 16% more often.*

A Pictorial View: Callicoon and Hale Eddy

At Harvard and Bridgeville

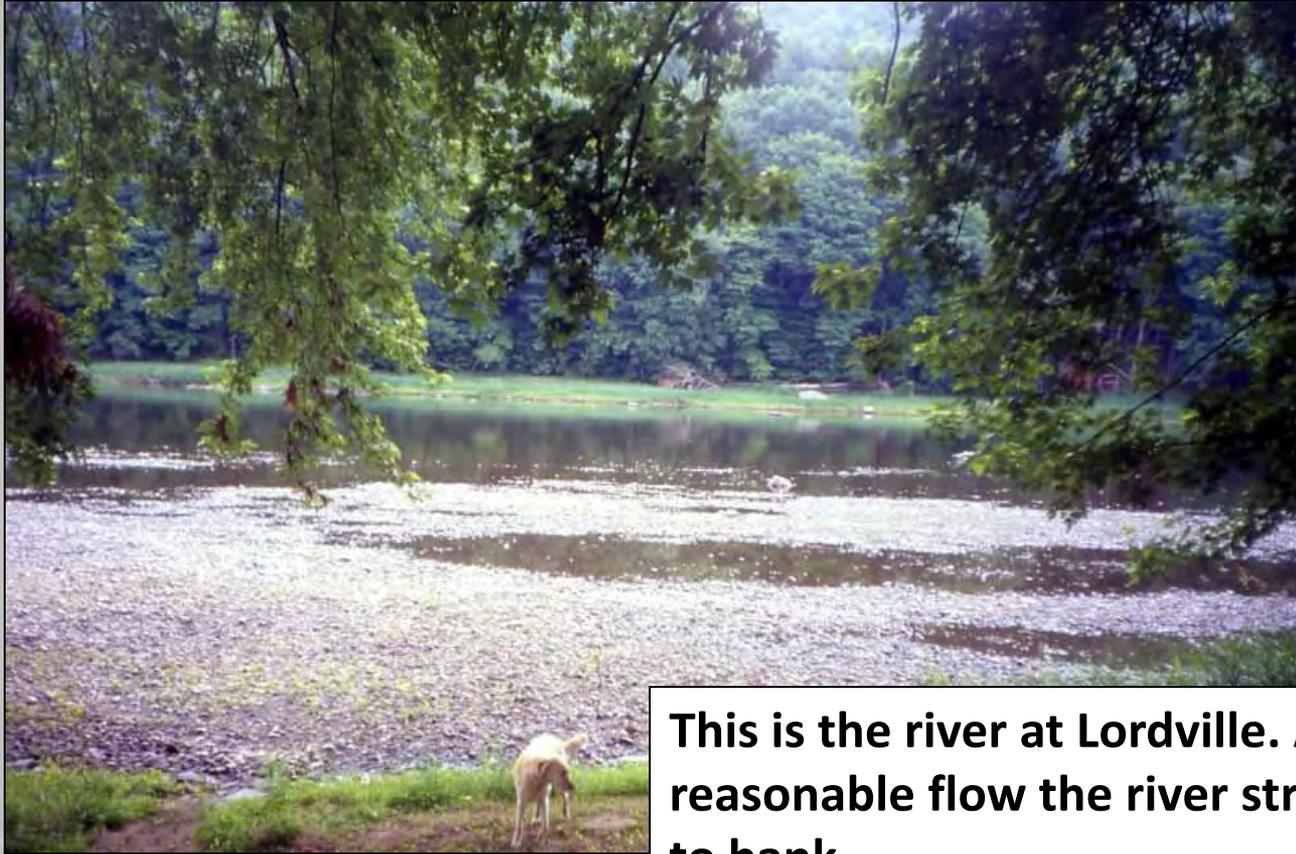

At Montague and Trenton

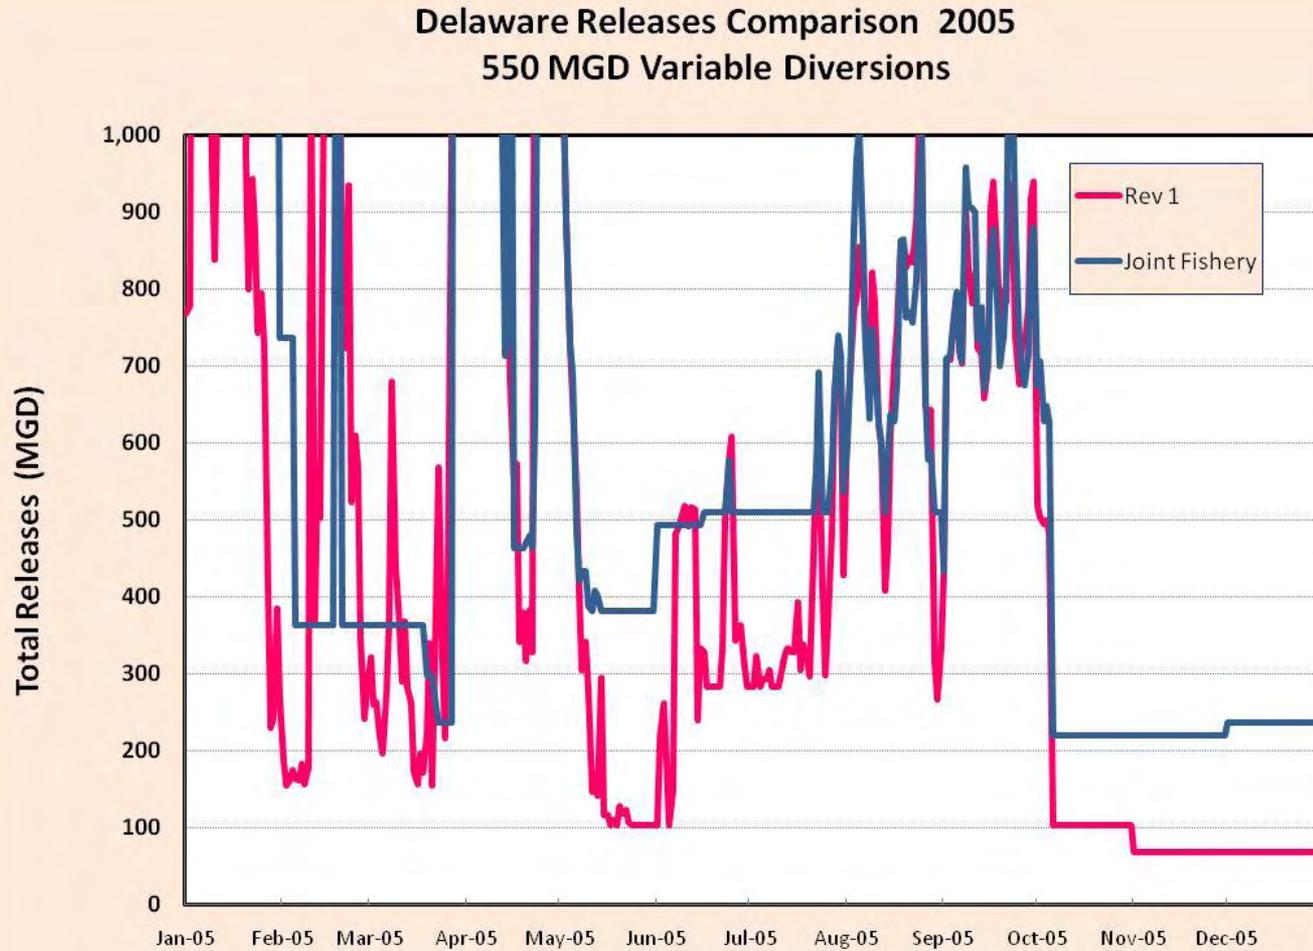

***Performance During the Thermal Crisis
of the Summer of 2005?***

The Delaware reservoirs stood at 89% capacity in July 2005 yet the Cannonsville release was only 125 CFS

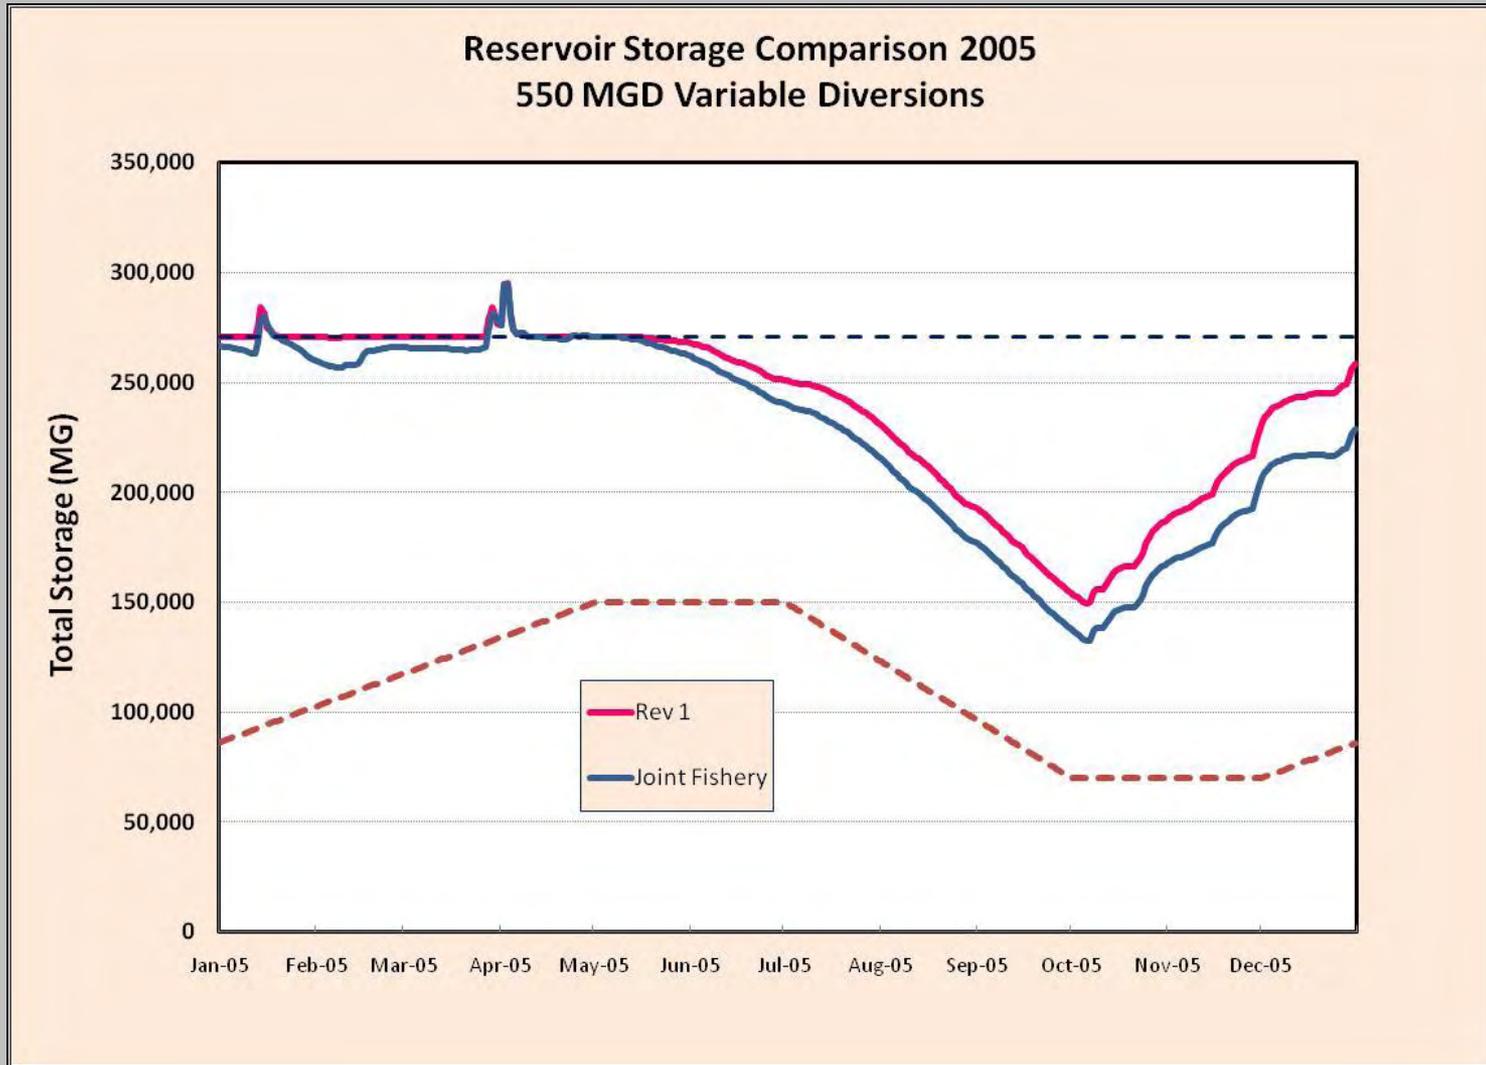

This is the river at Lordville. At a reasonable flow the river stretches bank to bank.

Revision 1 would repeat the disaster, while the Joint Fishery recommendation is one available solution

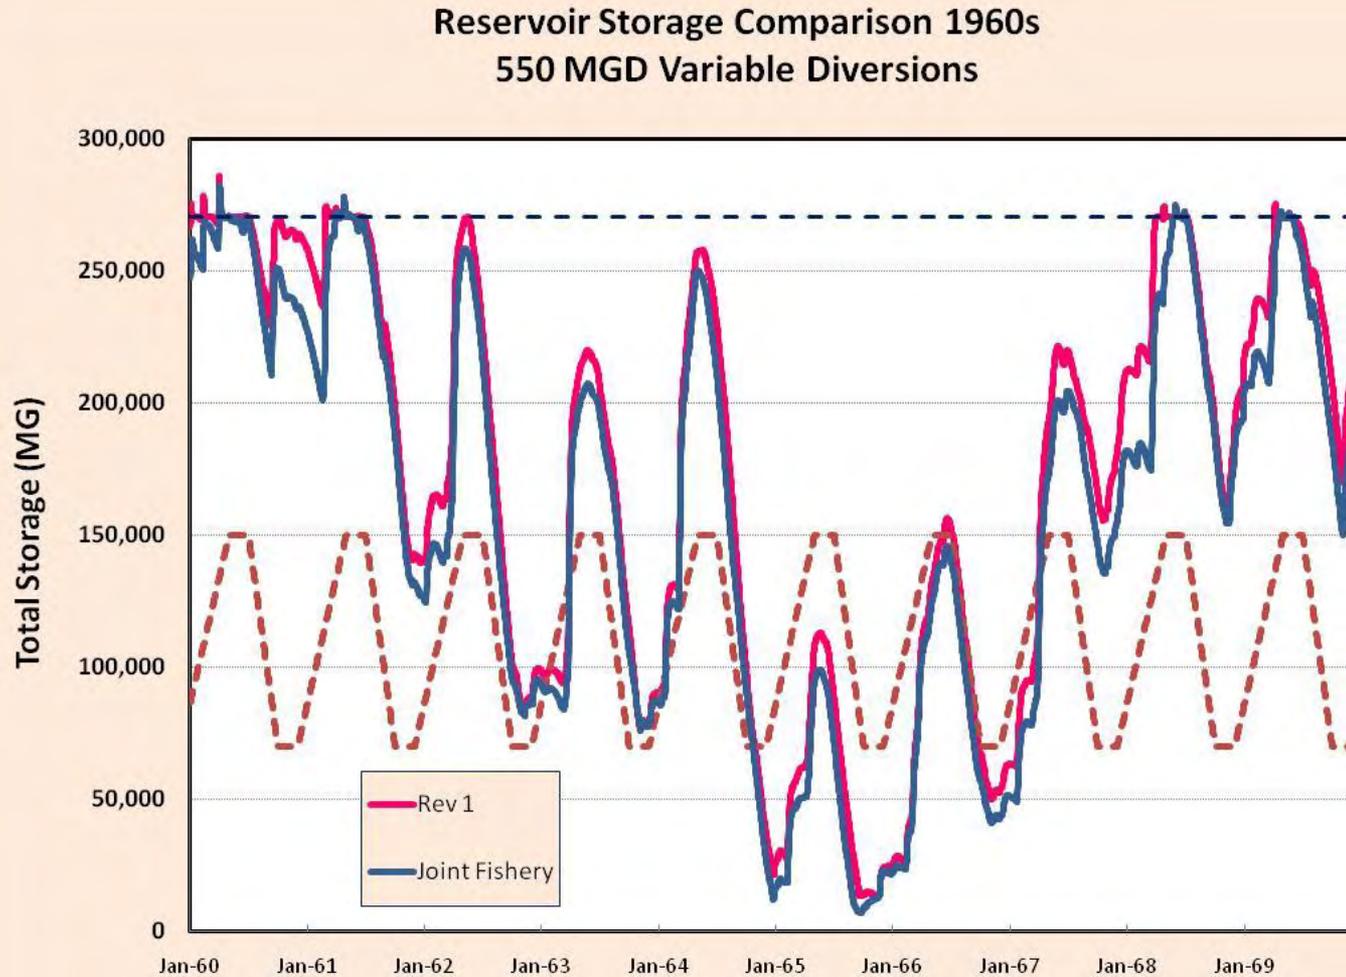

And at no increase in NYC water availability risk!

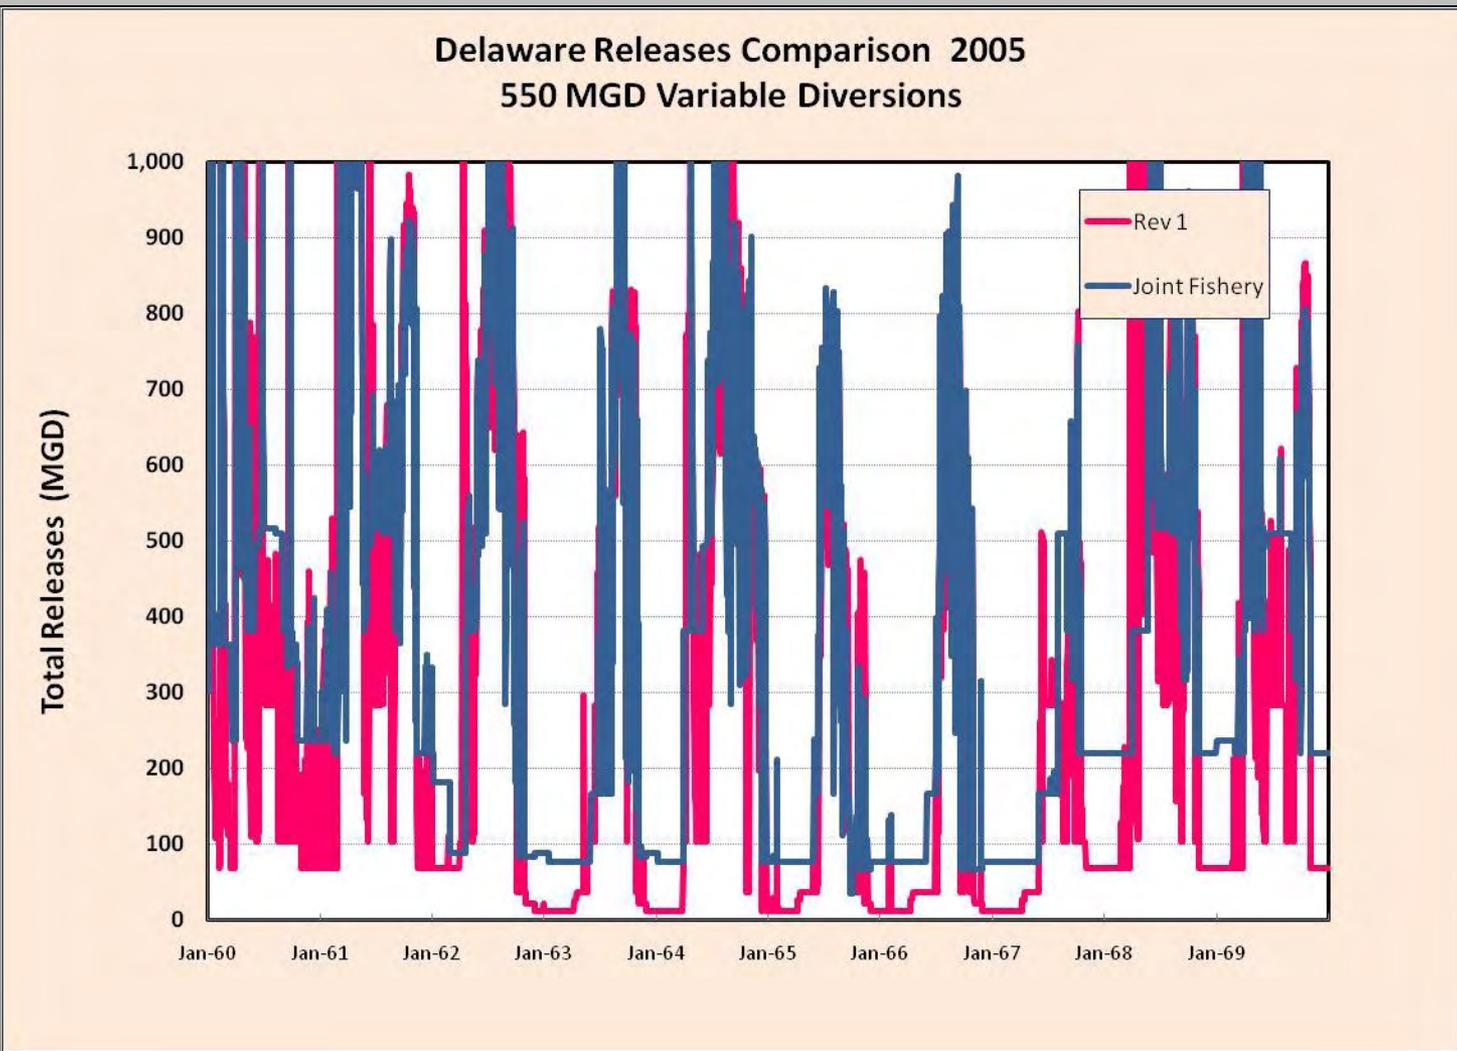

How about the drought of the century?

Reservoir Storage

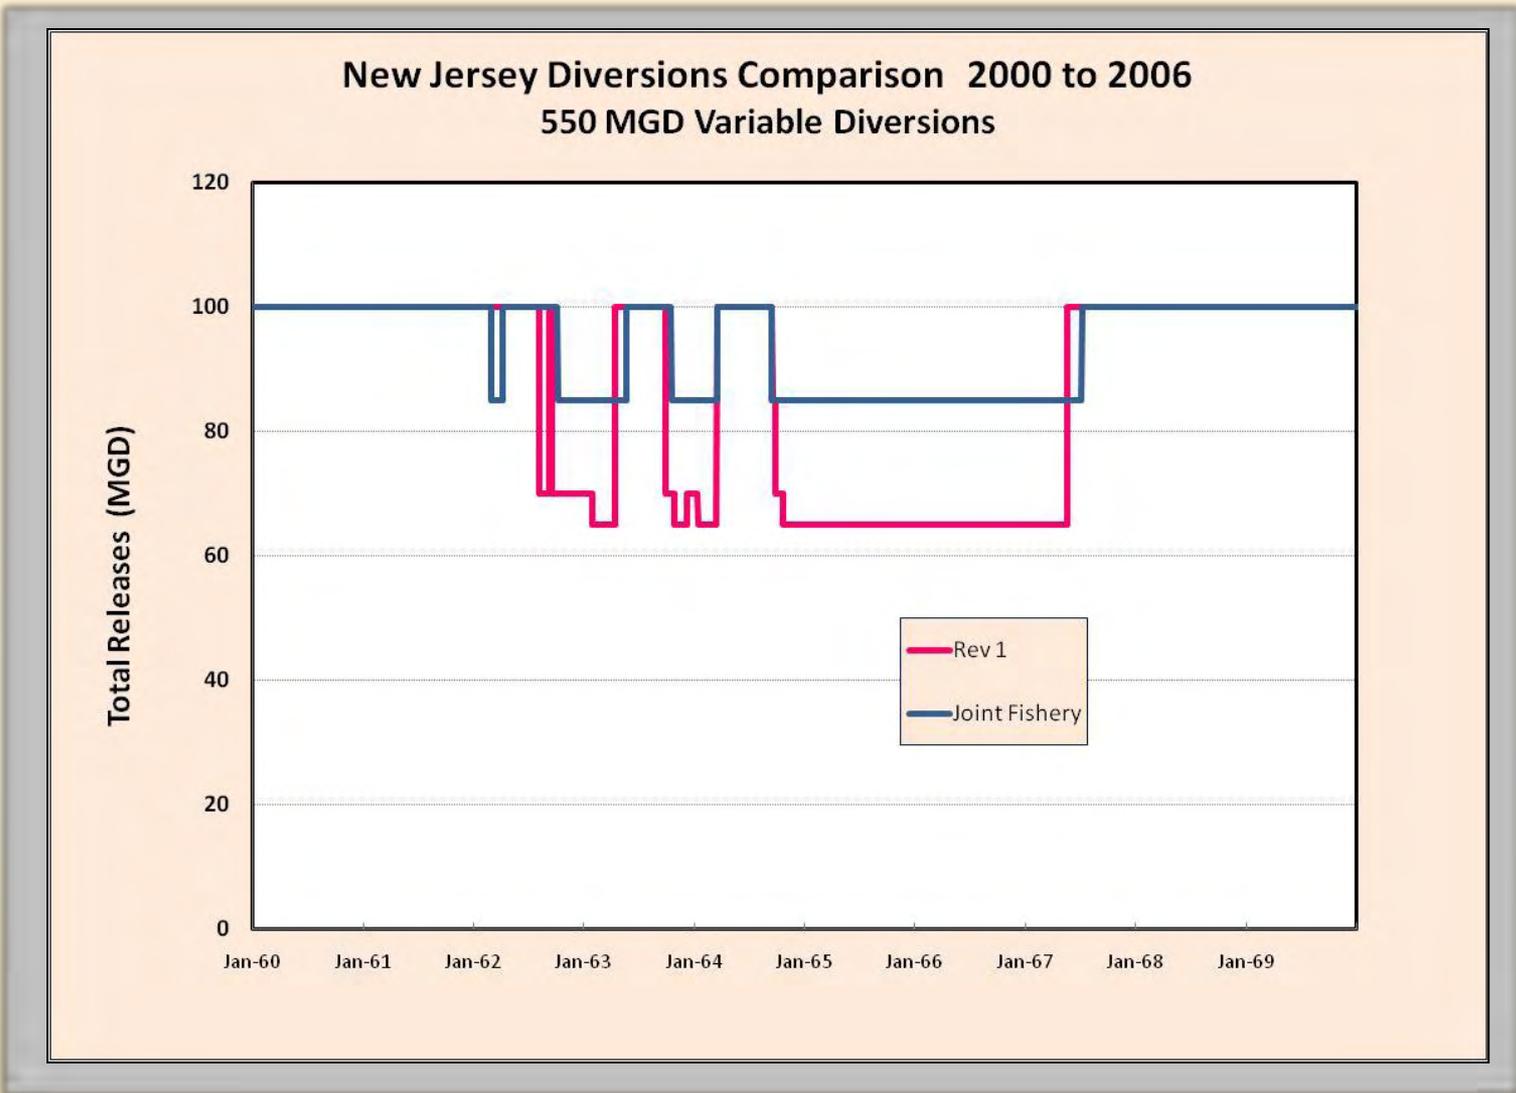

Is NYC water reliability threatened by Rev 1?

What is actually threatened most is the fishery!

And New Jerseys' diversions are reduced

Closing Thoughts

- These data show that Rev1 is clearly a major step backwards for the ecology of the Upper Delaware.
- Rev1 is also a step backward managerially and methodologically.
 - FFMP was a small first step toward bringing modern dam release methodology to the Delaware. We are now poised to take a next step by realistically recognizing the beneficial role of diversion and inflow forecasts.
 - Let's prepare for a future 'optimization' based release regime that balances all stakeholder interests . An enormous s body of science has been developed in this field -- shall we not use it?
- ***The Joint Fisheries recommendation provides a foundation for the future of the Delaware.***

A close-up photograph of two rainbow trout lying in a black fishing net. The fish are positioned horizontally, one above the other, with their heads pointing towards the right. The net's mesh is clearly visible, creating a grid pattern over the fish. The fish have silvery scales with a prominent rainbow-colored lateral stripe and dark spots. The text "The End" is overlaid in a bold, yellow, sans-serif font in the center of the image.

The End
