Subject: [EXTERNAL] Energy plan
Date: Saturday, September 14, 2019 5:28:49 PM

There are currently 13 plans to complete fossil fuel projects in the state. The seas are rising; the glaciers melting; storm intensity increasing; pathogens moving into New Jersey; and other warming areas; fires raging in the west; people losing their homes and lives all over the world due to energy policy.

Why are we putting money into more fossil fuel projects? This is total denial of a very serious problem. These should not be part of anything we condone, let alone part of a master energy plan. We need energy conservation and sources of non-carbon producing energy. (There is no such thing as renewable energy. It takes non-renewable resources to use solar, wind, geothermal, and, God forbid, nuclear energy). So let's stop fooling ourselves by thinking we can keep emitting carbon and other pollutants into our environment to sustain our wasteful lifestyles and let's make New Jersey a REAL leader in energy policy by using less energy and less dirty energy production methods.
