

Vector-borne Surveillance Report

CDC Week 28: July 12 - 18, 2026

Highlights:

- **Seventy-four additional mosquito pools tested positive for West Nile Virus (WNV) since last week's report. One hundred and fifty-eight mosquitoes have tested positive to date in 2026 from eighteen counties.**
- **The average number of Culex mosquitoes, which are associated with WNV transmission, was highest in Hudson, Bergen, and Salem counties.**
- **There have been no human or animal cases of WNV in 2026. There have been no human, animal, or mosquito detections of Eastern equine encephalitis (EEE) or Jamestown Canyon virus (JCV) in 2026.**
- **The number of Lyme disease cases this week decreased and is below historical averages.**
- **The number of tick-related emergency department visits decreased slightly this week but remains consistent with historical averages.**

Human Vector-borne Disease Cases

N.J.A.C. 8:57 mandates public health reporting of communicable diseases. 2026 data reflect cases that have been approved by NJDOH and do not include cases under investigation. Due to the time needed for public health investigation, the number of tickborne diseases (except for Lyme disease) may be significantly lower than actual counts and should be interpreted with caution. All 2026 numbers are preliminary and subject to change. Some cases are considered "presumptive positive" and are pending additional testing. Case counts for 2025 reflect the annual total for that year.

Mosquito-borne Diseases			Tickborne Diseases/Conditions		
	2026	2025		2026	2025
Chikungunya	2	10	Alpha-Gal Syndrome	241	517
Dengue	7	14	Anaplasmosis	126	312
Malaria	43	89	Babesiosis	93	372
West Nile	-	23	Ehrlichiosis	54	98
Zika	1	-	Hard Tick Relapsing Fever	1	14
Eastern Equine Encephalitis	-	-	Lyme Disease	3525	6597
Jamestown Canyon	-	-	Powassan	-	2
			Spotted Fever Group Rickettsioses	16	25
			Tularemia	1	1

Mosquito-borne Disease Activity

The New Jersey Department of Health Public Health and Environmental Laboratories (PHEL) and the Cape May County Department of Mosquito Control Bio-safety Level 3 Laboratory (CMBSL3) perform arboviral testing on mosquito pools collected by county mosquito control agencies throughout NJ.

Test results may be incomplete as counties submit pools for testing on specific weekdays. Data reflects test results downloaded from JerseySurv on July 23, 2026 at 2:00 pm.

West Nile Virus

- There have been no human or animal cases of WNV reported in NJ in 2026. In 2025, the earliest human case was reported in Week 30.
- State mosquito surveillance and testing started May 18th, although some counties collected "early season" samples (403 mosquito pools collected prior to week 20). All 21 counties have submitted mosquitoes for testing in 2026 and out of 4,521 pools tested, 158 have tested positive for WNV in eighteen counties.
- WNV has been detected in *Culex pipiens/restuans/salinarius* (133), *Cx. pipiens* (17), *Aedes japonicus* (3), *Ae. albopictus* (1), *Ae. vexans* (1), *Cx. restuans* (1), *Cx. salinarius* (1), and *Cx. territans* (1) mosquitoes.

Average Mosquito Abundance, *Culex* spp., Week 27 – 28*

* Average mosquito abundance is defined as the average number of mosquitoes caught per trap night over a defined period and is calculated based on *Culex pipiens*, *restuans*, and *salinarius* species caught in NJ Light Traps (NJLT) only. These species are associated with WNV transmission.

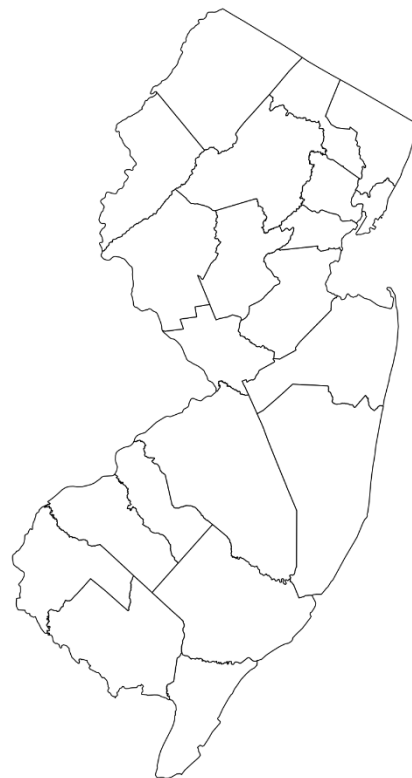

Eastern Equine Encephalitis

- There have been no human or animal cases of EEE reported in 2026. EEE human cases were last reported in 2024 (2 cases).
- Out of 4,483 mosquito pools from 21 counties tested for EEE, none have tested positive.
- In 2025, the first EEE positive pool was detected in week 33 in Atlantic County.

2026 EEE Activity

Jamestown Canyon Virus

- There have been no human cases of JCV reported in NJ in 2026. In 2025, there were two human cases of JCV from Middlesex and Burlington counties.
- Out of 4,483 mosquito pools from 21 counties tested for JCV, none have tested positive.
- In 2025, the first JCV positive pool was detected in week 29 in Sussex County.

Other Mosquito-borne Diseases

- Mosquito pools in 21 counties have been tested for St. Louis encephalitis with no positive results.
- Mosquito pools in 8 counties have been tested for La Crosse encephalitis with no positive results.
- Mosquito pools in 4 counties have been tested for Chikungunya, Dengue, and Zika viruses with no positive results.

Numbers in white columns represent number of pools tested to date in 2026

Number in green shaded columns represent positive pools in 2026

Tickborne Disease Activity

Lyme Disease

- There have been 3,525 cases of Lyme disease reported in NJ in 2026.
- The number of cases in week 28 is lower compared to the previous week and is below the four-year average.
- The largest number of Lyme disease cases has been reported in the northwestern part of the state (Hunterdon, and Morris counties) as well as in Ocean County.

Lyme Disease Cases, 2026

Tick-related Emergency Department Visits

The chart below represents NJ residents seen at emergency departments with a tick-bite complaint or signs/symptoms associated with a reported tick bite relative to total ED visits. The number of tick-related emergency department visits decreased slightly in week 28 and is consistent with the 5-year average.
