Vector-borne Surveillance Report

CDC Week 44: Nov 1 - 7, 2026

Highlights:

- ***This is the final week of routine mosquito surveillance. While some additional test results may be pending, in the absence of notable events, this will be the final weekly report for 2026. The public dashboard will continue to be updated weekly and a 2026 summary report will be posted online in early 2027.***
- ***No additional cases of West Nile virus (WNV) are reported this week. To date, in 2026 there have been 38 cases, including five deaths, and six presumptive viremic donors (PVDs). WNV cases have been reported in 15 counties, with the highest numbers reported in Camden (6), Monmouth (6), and Mercer (4).***
- ***Since last week's report, one additional mosquito pool tested positive for WNV, for a total of 1,301 positive pools for the season, which is higher than historical trends.***
- ***To date, one mosquito pool has tested positive for Eastern Equine Encephalitis (EEE), eight pools for JCV, and one pool for La Crosse virus (LAC).***
- ***The number of tick-related emergency department (ED) visits increased this week compared with the previous week and remained consistent with the historical average.***

Human Vector-borne Disease Cases

N.J.A.C. 8:57 mandates public health reporting of communicable diseases. 2026 data reflect cases that have been approved by NJDOH and do not include cases under investigation. Due to the time needed for public health investigation, the number of tickborne diseases (except for Lyme disease) may be significantly lower than actual counts and should be interpreted with caution. All 2026 numbers are preliminary and subject to change. Some cases are considered "presumptive positive" and are pending additional testing. Case counts for 2025 reflect the annual total for that year.

Mosquito-borne Diseases			Tickborne Diseases/Conditions

Mosquito-borne Disease Activity

The New Jersey Department of Health Public Health and Environmental Laboratories (PHEL) and the Cape May County Department of Mosquito Control Bio-safety Level 3 Laboratory (CMBSL3) perform arboviral testing on mosquito pools collected by county mosquito control agencies throughout NJ.

Test results may be incomplete as counties submit pools for testing on specific weekdays. Data reflects test results downloaded from JerseySurv on November 12, 2026, at 12:00 pm.

West Nile Virus

- Thirty-eight human cases of WNV have been reported in 2026 from 15 counties, including five deaths, and six PVDs have been reported from five counties. No animal cases of WNV were reported in 2026.
- State mosquito surveillance and testing started May 18th, although some counties collected "early season" samples (403 mosquito pools collected prior to week 20). Out of 11,978 pools tested, 1,301 have tested positive for WNV in 21 counties.
- WNV has been detected in *Culex pipiens/restuans/salinarius* (1,074), *Cx. pipiens* (78), *Aedes albopictus* (56), *Ae. japonicus* (37), *Cx. restuans* (15), *Ae. triseriatus* (9), *Anopheles punctipennis* (8), *Culiseta melanura* (7), *Ae. vexans* (4), *An. quadrimaculatus* s.l. (2), *Cx. erraticus* (2), *Cx. salinarius* (2), *Cx. territans* (2), *Ae. stricticus* (1), *Ae. taeniorhynchus* (1), *An. bradleyi* (1), *Coquillettidia perturbans* (1), and *Psorophora ciliata* (1) mosquitoes.

Average Mosquito Abundance, *Culex* spp., Week 43 – 44*

[t] Average mosquito abundance is defined as the average number of mosquitoes caught per trap night over a defined period and is calculated based on *Culex pipiens, restuans, and salinarius* species caught in NJ Light Traps (NJLT) only. These species are associated with WNV transmission.

Eastern Equine Encephalitis

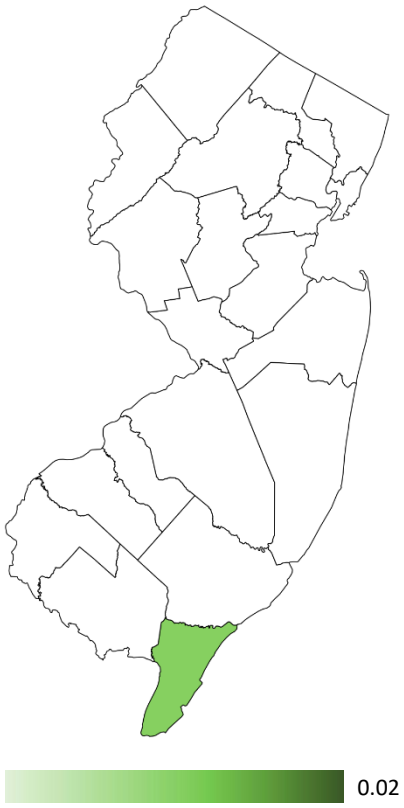

- There have been no human or animal cases of EEE reported in 2026. EEE human cases were last reported in 2024 (2 cases).
- Out of 11,810 mosquito pools tested for EEE, one pool tested positive from Cape May County in week 35. EEE was detected in *An. punctipennis* mosquitoes.
- In 2025, the first EEE positive pool was detected in week 33 in Atlantic County.

2026 EEE Activity

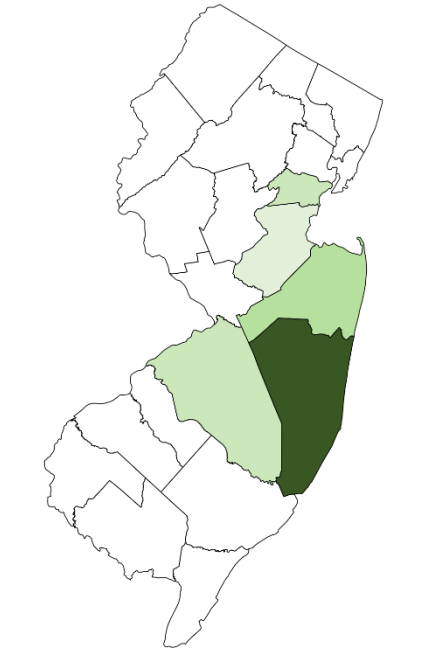

Jamestown Canyon Virus

- No human cases of JCV were reported in NJ in 2026. In 2025, there were two human cases from Middlesex and Burlington counties.
- Out of 11,810 mosquito pools tested for JCV, eight pools were positive in Monmouth (3), Ocean (2), Burlington, Middlesex, and Union counties. JCV was detected in *Ps. columbiae* (3), *Ae. albopictus* (1), *Ae. atlanticus/tormentor* (1), *An. bradleyi* (1), *Ae. sollicitans* (1), and *Cx. pipiens/restuans/salinarius* (1) mosquitoes.
- In 2025, the first JCV positive pool was detected in week 29 in Sussex County.

Other Mosquito-borne Diseases

- Mosquito pools in selected counties have been tested for St. Louis encephalitis, La Crosse virus, Chikungunya, Dengue, and Zika.
- One mosquito pool was positive for La Crosse virus in Sussex in week 36.

Tickborne Disease Activity

Lyme Disease

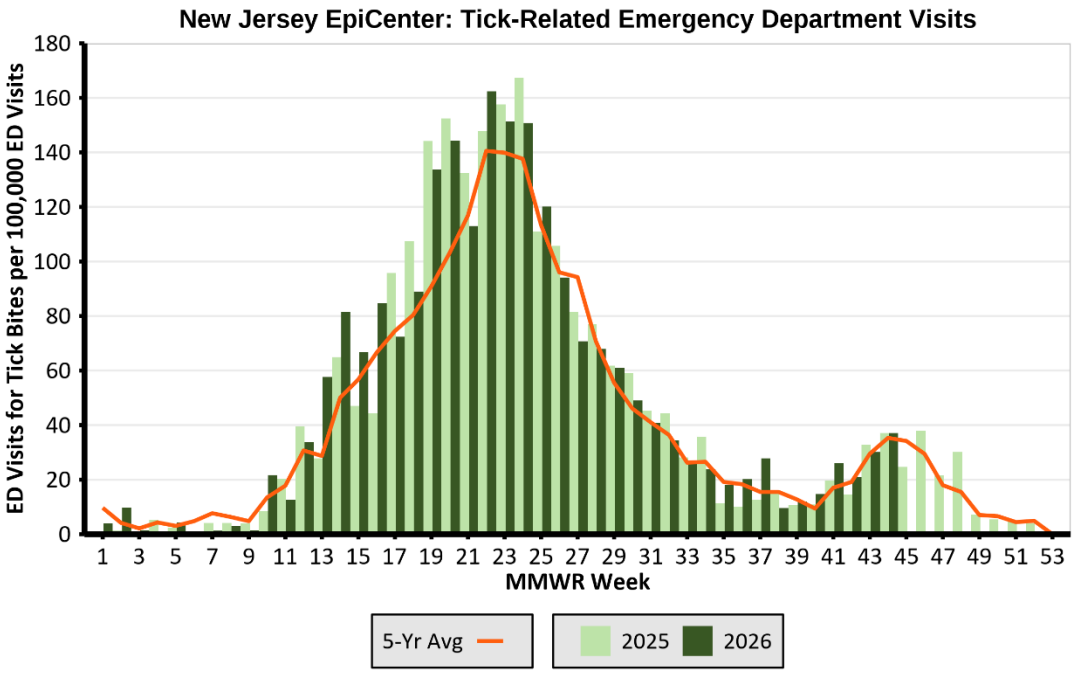

- There have been 5,785 cases of Lyme disease reported in NJ in 2026.
- The number of cases increased this week and is slightly above the four-year average.
- Most Lyme disease cases have been reported in the northwestern part of the state (Hunterdon, Morris, and Sussex counties) as well as in Ocean and Monmouth counties.

Tick-related Emergency Department Visits

The chart below represents NJ residents seen at emergency departments with a tick-bite complaint or signs/symptoms associated with a reported tick bite relative to total ED visits. The number of tick-related emergency department visits increased this week and remains consistent with historical trends.
