

## Report Highlights:

- NJDOH is reporting one additional human case of West Nile Virus (WNV) in Camden County. To date, there have been 36 reported WNV cases, including seven deaths and six presumptive viremic donors (PVDs) including one that met the case definition. Ninety-two percent of WNV cases were hospitalized. An additional 6 mosquito pools tested positive for WNV since last report, for a total of 993 WNV positive pools in 2024.
- No new human or animal cases of Eastern Equine Encephalitis (EEE) or mosquito detections are reported this week. To date, there have been two human EEE cases from Atlantic and Sussex counties and four horses from Atlantic, Ocean (2), and Salem counties that tested positive for EEE. There has been a total of 17 EEE positive mosquito pools in 2024.
- No new human cases of Jamestown Canyon Virus (JCV) or mosquito detections are reported this week. To date, there has been one human case of JCV in Sussex County and detections in four mosquito pools in Cumberland and Monmouth counties.
- One additional travel-associated dengue case is reported this week, for a total of 110 travel-associated dengue cases in 2024. Cases are associated with outbreaks in several Latin American countries.
- The number of Lyme disease cases and the number of tick-related emergency department (ED) visits increased but remain slightly below average this week. The highest number of ED visits was in the Northwest region.

## Human Vector-borne Disease Cases

N.J.A.C. 8:57 mandates public health reporting of communicable diseases. 2024 data reflect cases that have been approved by NJDOH and do not include cases under investigation. Due to the time needed for public health investigation, the number of tickborne diseases (except for Lyme disease) may be significantly lower than actual counts and should be interpreted with caution. Lyme disease surveillance transitioned to laboratory-based surveillance in 2022. All 2024 numbers are preliminary and subject to change. Some cases are considered “presumptive positive” and may be pending additional testing. Case counts for 2023 reflect the annual total for that year.

	Mosquito-borne diseases		Tickborne Diseases/Conditions		
	2024	2023		2024	2023
Chikungunya	8	13	Alpha-gal syndrome	187	360
Dengue	110	98	Anaplasmosis	130	195
Eastern equine encephalitis	2	-	Babesiosis	232	407
Jamestown Canyon	1	1	<i>Borrelia miyamotoi</i>	12	18
Malaria	63	102	Ehrlichiosis	75	109
West Nile	36	14	Lyme disease	5,607	7,225
Zika	-	-	Powassan	1	-
			Spotted fever group rickettsioses	17	24
			Tularemia	2	2

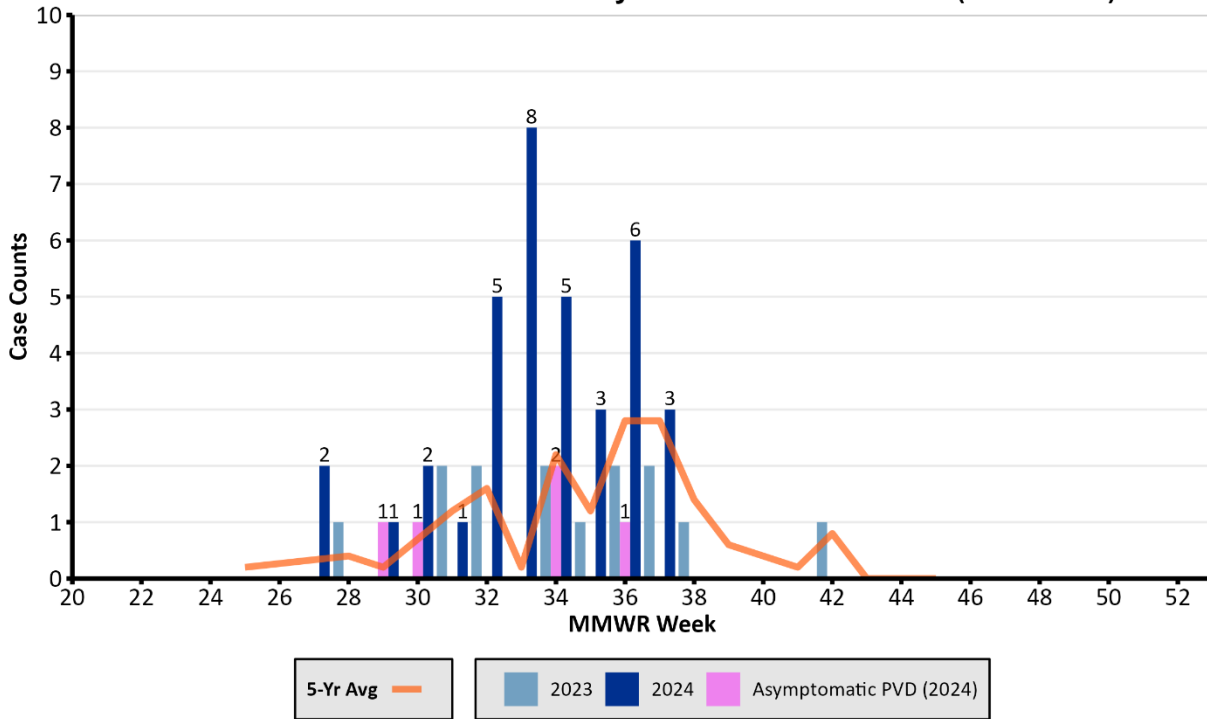

## Mosquito-borne Disease Activity\*

\*Test results may be incomplete as counties submit pools for testing on specific weekdays. Data reflects test results downloaded from JerseySurv on November 14, 2024.

### West Nile Virus

- Thirty-six human cases of WNV have been reported in 2024 from Bergen (6), Burlington (2), Camden (5), Cape May, Cumberland (2), Essex (2), Hudson, Hunterdon, Mercer (2), Middlesex (3), Monmouth (4), Ocean (3), Union (2), and Warren (2) counties. There were seven deaths reported in Bergen, Camden, Cumberland, Mercer, Middlesex, Monmouth, and Ocean counties. There have been six PVDs in Bergen, Camden (2), Essex, Passaic, and Somerset counties including one that met the case definition.
- One emu tested positive for WNV in week 36 from Monmouth County. Three red-tailed hawks tested positive for WNV in week 28 in Essex and Morris counties.
- Out of 12,677 mosquito pools submitted for testing, 993 mosquito pools have tested positive for WNV this year. The most WNV positive pools have been detected in *Culex pipiens/restuans/salinarius* (838), *Cx. pipiens* (63), and *Ae. albopictus* (41) mosquitoes.
- The earliest WNV positive mosquito pools (*Cx. pipiens/restuans/salinarius*) were detected in week 18 from Gloucester County (2), considerably earlier than 2023, when WNV was initially detected in week 24 from Bergen County.

### WNV Vector Index, WEEK 45<sup>†</sup>

<sup>†</sup> Vector Index is calculated based on *Ae. taeniorhynchus*, *An. quadrimaculatus*, and all *Culex* species caught in gravid traps only.

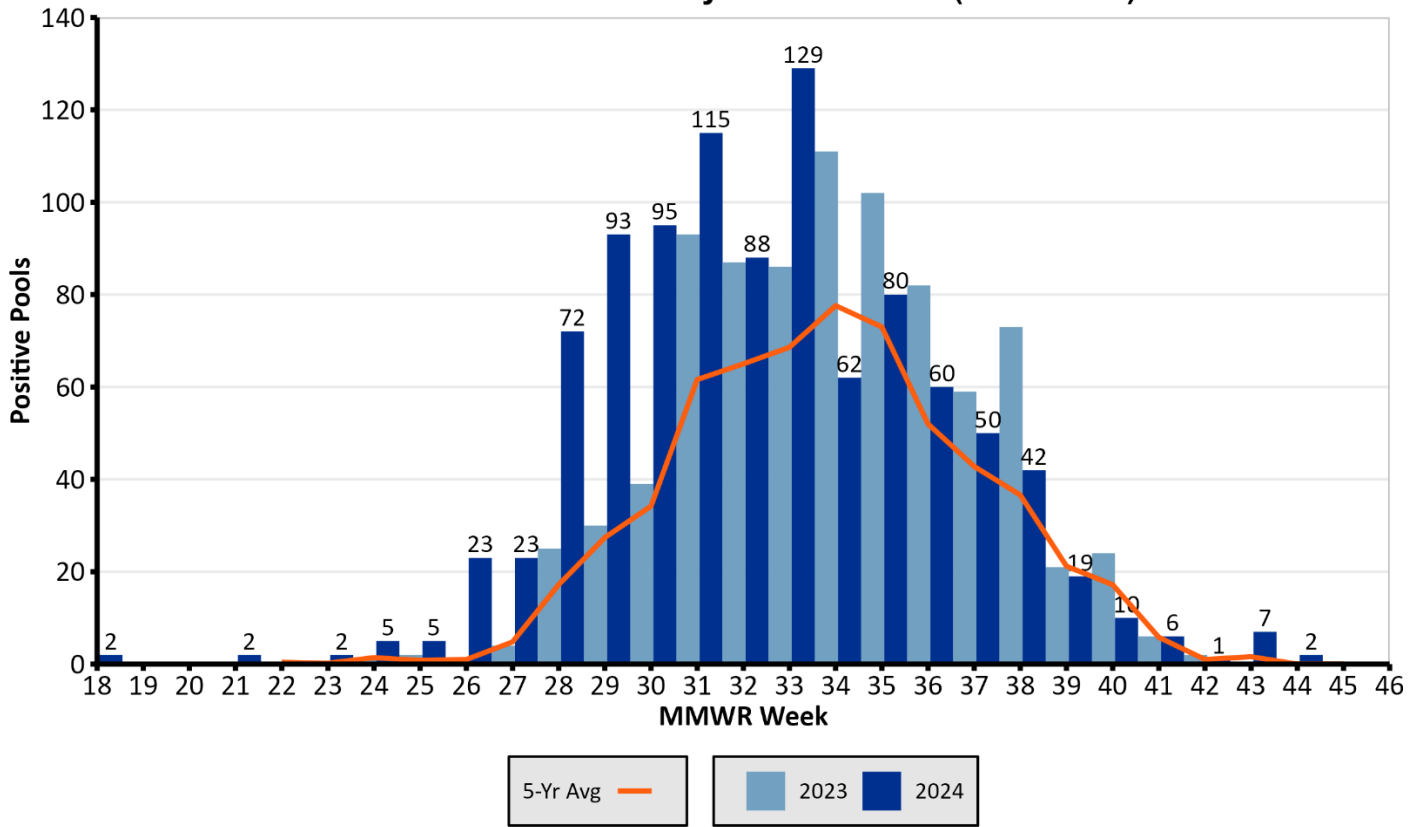

WEEK 45: Nov 5 - 11, 2023; Nov 3 - 9, 2024.

\*184 mosquito pools submitted by 8 counties were collected prior to Week 20.

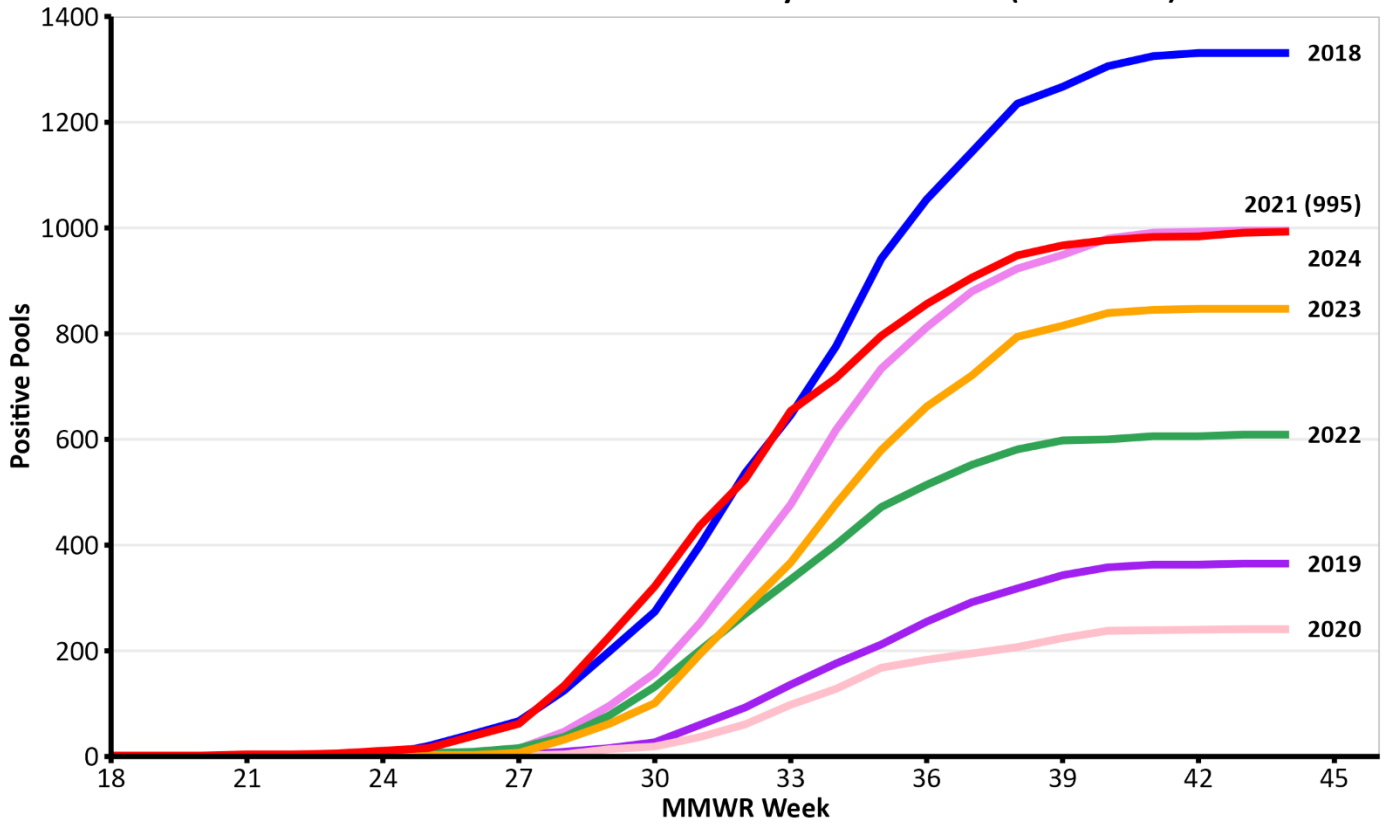

\*If all tested pools are positive, Vector Index cannot be calculated. In these situations, the county is shown on the map with red stripes to indicate elevated activity.

<sup>‡</sup> Prior 2024 reports included results from rapid tests for Bergen County. Numbers have been amended to exclude these test results.

- ✈ ≥ 1 WNV avian case

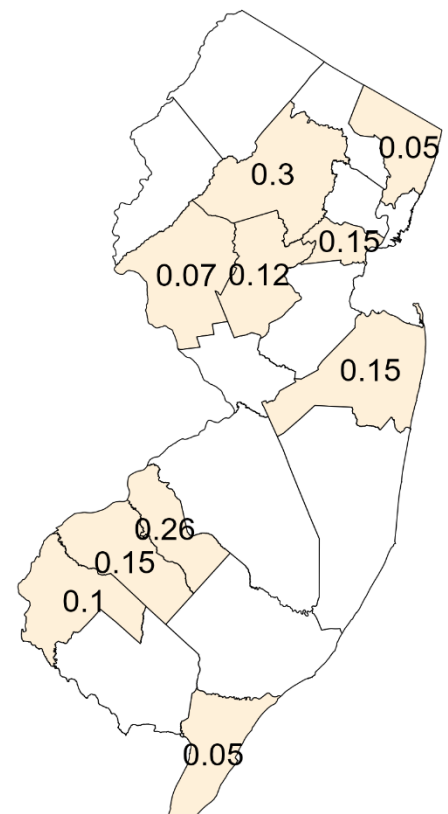

### Eastern Equine Encephalitis (EEE)

- Two human cases of EEE were reported in week 27 in Atlantic County and week 39 in Sussex County. EEE human cases were last reported in 2019 (4 cases).
- Four horses tested positive for EEE in week 31 in Atlantic County, week 33 in Ocean County (2), and in week 36 in Salem County. None of the horses were vaccinated.
- Out of 12,582 mosquito pools tested for EEE, 17 pools have tested positive in 2024. The positive pools were found in *Coquillettidia perturbans* (1), *Cx. restuans* (1), *Culiseta melanura* (9), *Culiseta morsitans* (1), and *Cx. pipiens/restuans/salinarius* (5) mosquitoes.
- The earliest EEE positive mosquito pool (*Cx. restuans*) was detected in week 27 from Cape May County.

## Jamestown Canyon Virus (JCV)

- There was one human case of JCV reported in New Jersey in 2024 in week 19 in Sussex County. In 2023, there was one human case of JCV in week 45 in Sussex County.
- Out of 12,582 mosquito pools tested for JCV, 4 pools have tested positive this year. The positive pools were found in *Ae. cantator* (1), *Anopheles punctipennis* (1), *Cx. salinarius* (1), and *Psorophora columbiae* (1) mosquitoes.
- In 2023, the first JCV positive pool was detected in week 23 from Cumberland County.

## Human Dengue Virus Cases

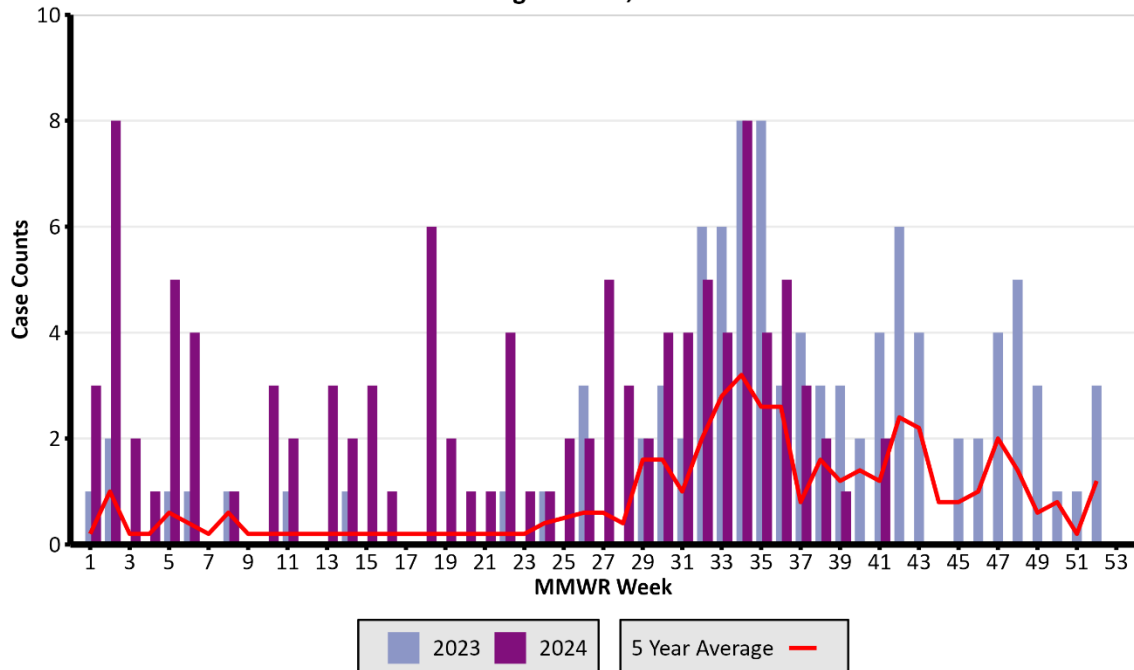

- There have been 110 cases of dengue virus reported to date in 2024, which is considerably higher than the number reported this time last year (79).
- All dengue cases are travel-associated and the high case count is driven by outbreaks in several Latin American countries. Most NJ cases reported travel to a country or US territory in Latin America or the Caribbean.
- Many of the NJ cases are concentrated in the northeast region, with most cases residing in Bergen (17), Middlesex (15), and Essex (13) counties.

Travel Destination(s) of Dengue Cases

### Dengue Cases

NJ Dengue Cases, 2023 - 2024

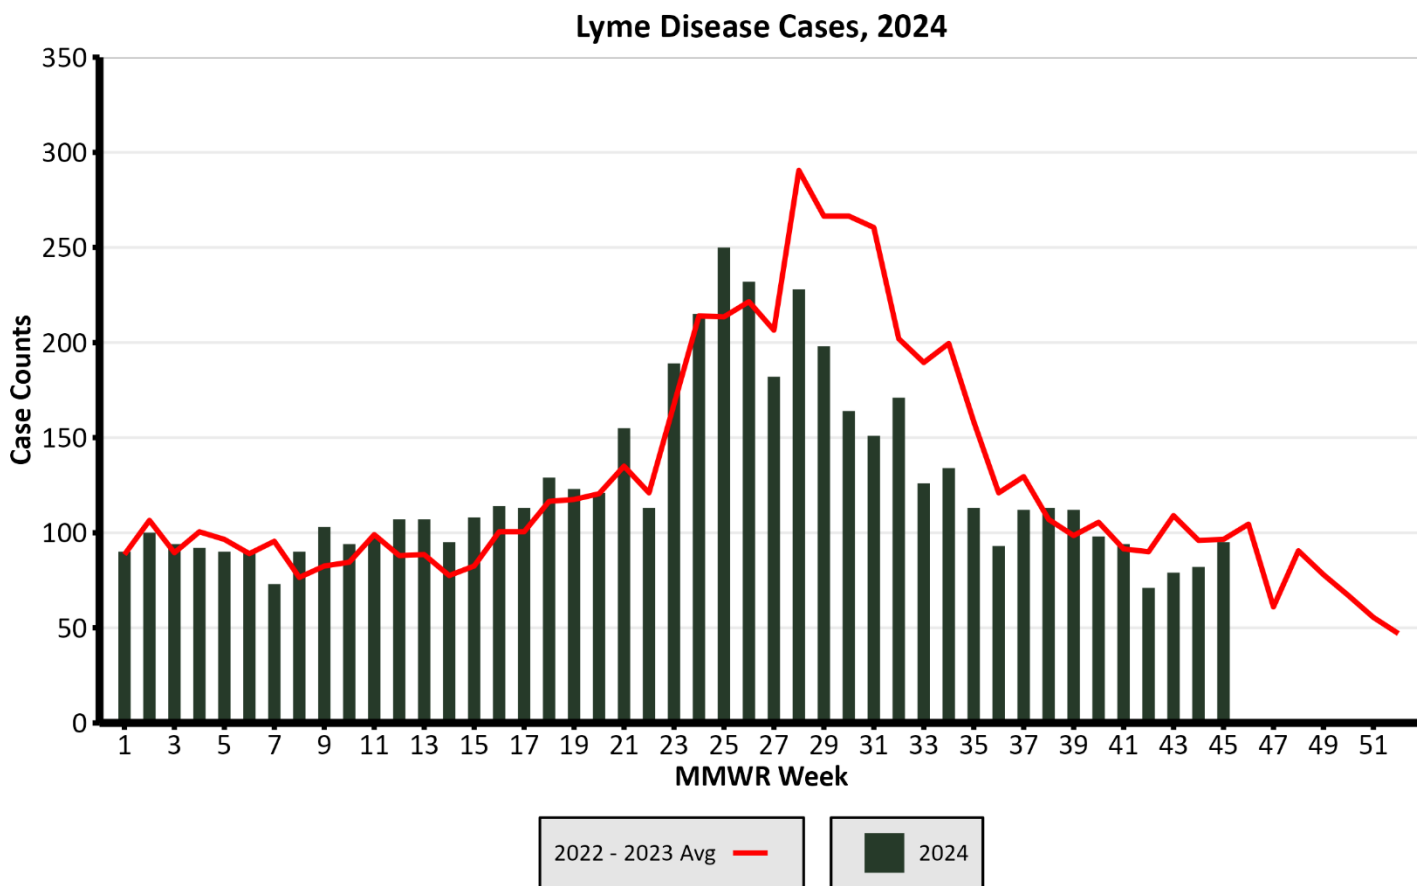

## Tickborne Disease Activity

### Lyme Disease

- There have been 5,607 cases of Lyme disease reported in New Jersey in 2024.
- The number of cases in Week 45 increased and remains slightly below the average number of cases reported this week.

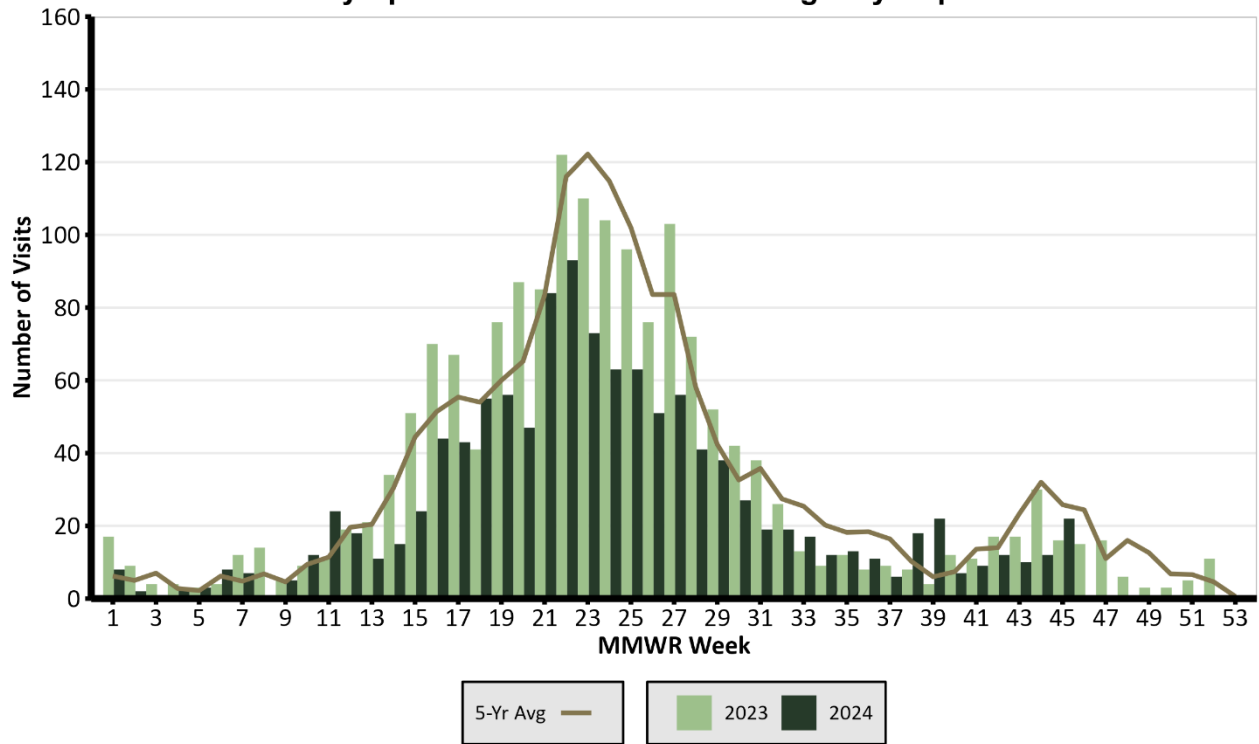

### Tick-related Emergency Department Visits

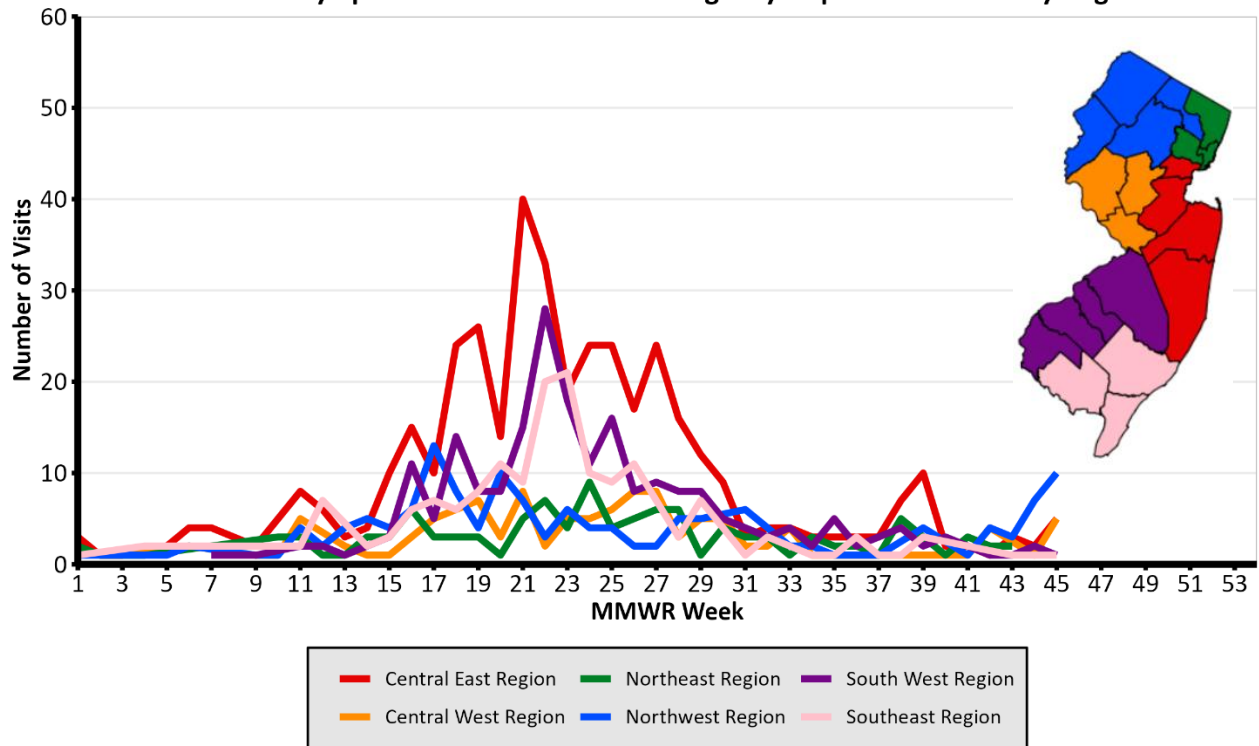

New Jersey's syndromic surveillance system, known as EpiCenter, receives real time Emergency Department (ED) data from 78 acute care and satellite health (99 percent reporting) facilities statewide. The system collects "chief complaint" information and limited patient registration data from existing ED computer systems. The chart below represents N.J. residents seen at emergency departments statewide with a tick-bite complaint or signs/symptoms associated with a reported tick-bite. Tick-related ED visits occur throughout the year with peak number of visits in the summer months and a smaller peak in the fall weeks when adult *Ixodes scapularis* (blacklegged ticks) are active.

In Week 45, the number of tick-related ED visits increased but remains below the 5-year average. The highest number of visits was in the Northwest region.
