Per- and Polyfluoroalkyl Substances (PFAS) in Drinking Water

**General information**

PFAS are a large group of manmade chemicals which repel water and oil and are resistant to heat and chemical reactions. Because of these properties, they have important industrial and commercial uses and have been used since the 1940s. PFAS are used in the production of some non-stick cookware, in waterproof and stain proof coatings, in “leak-proof” coatings on food packaging materials, in fire-fighting foams, and other applications.

PFAS can enter drinking water through industrial release to water, air, or soil; discharges from sewage treatment plants; land application of contaminated sludge; leaching from landfills; and use of certain fire-fighting foams. These chemicals do not break down in the environment.

Four types of PFAS have been found in the blood (serum) of greater than 98% of the United States population. These long-chain PFAS build up and stay in the human body for many years. The levels decrease very slowly over time after exposure is reduced or stopped.

- **PFOS**: perfluorooctane sulfonate
- **PFOA**: perfluorooctanoic acid
- **PFNA**: perfluorononanoic acid
- **PFHxS**: perfluorohexane sulfonate

**Exposure to PFAS**

PFOA, PFOS, and PFNA dissolve in water. If drinking water is contaminated, it is a primary source of exposure to PFAS as compared with other common exposure sources. Other sources of exposure to these PFAS include food, food packaging, consumer products, house dust, indoor and outdoor air, and workplaces where PFAS are used or made. Exposure in drinking water is primarily from ingestion of the water and food prepared with the water. These PFAS are not removed from water by boiling. Exposure to these PFAS from showering, bathing, laundry, dishwashing, and rinsing produce is not significant.

**Health effects of PFAS**

Studies of the general population, communities with PFAS-contaminated drinking water, and exposed workers indicate that exposure to PFAS increases the risk of a number of health effects. Health effects from PFAS are observed within the general population even without exposure to PFAS from contaminated drinking water.

The most consistent human health effect findings for PFOA and PFOS – the most well studied of the PFAS types – are increases in serum cholesterol and uric acid levels in the blood and decreased antibody response following vaccination, as well as increased blood levels of some liver enzymes for PFOA. Although not as well studied, PFNA appears to increase blood levels of cholesterol and some liver enzymes. Human health effects of these PFAS are generally consistent with the toxicity of PFAS observed in laboratory animals.

PFOA and PFOS caused tumors in rodents, while PFNA has not been tested for this effect. In humans, PFOA exposure was associated with a higher incidence of kidney cancer in both the general population and in a community with substantial levels of PFOA in drinking water, and with testicular cancer in the community with contaminated drinking water.

The Centers for Disease Control and Prevention’s Agency for Toxic Substance Disease Registry (CDC/ATSDR) is conducting the “PFAS Multi-site Study,” to learn more about the relationship between PFAS exposure and health outcomes. This work is taking place across seven U.S. communities exposed to PFAS-contaminated drinking water. Work is ongoing, and results are pending. To learn more visit bit.ly/ATSDR-PFAS
**Impact of PFAS on children**

Infants and children consume more water per body weight than older individuals, so their exposure may be higher than adults when drinking water is contaminated with PFAS. They may also be more sensitive to the effects of PFAS.

In humans, exposure to PFAS before birth or in early childhood may result in health effects including decreased birth weight, decreased response to vaccinations, and increased risk of infectious disease. In laboratory animals, some PFAS, including PFOA, PFOS, PFNA, and many others, cause developmental delays.

**Can I have my blood tested for PFAS?**

Laboratory tests are available to measure PFAS in blood serum, but this is not a routine test. Health insurance may not cover the cost of this testing. While pursuing this type of specialized testing is a personal decision between you and your doctor, it is important to understand what testing can and cannot tell you.

**What blood testing can tell you –**

- Blood test results can be compared to national monitoring data collected from a representative sample of the U.S. population. The table below provides the most recently available (2017-2018) blood serum levels of the four PFAS most commonly detected in the U.S. population.

<table>
<thead>
<tr>
<th>PFAS</th>
<th>Mean (geometric)</th>
<th>50th percentile</th>
<th>95th percentile</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFOS</td>
<td>4.25</td>
<td>4.30</td>
<td>14.6</td>
</tr>
<tr>
<td>PFOA</td>
<td>1.42</td>
<td>1.47</td>
<td>3.77</td>
</tr>
<tr>
<td>PFNA</td>
<td>0.41</td>
<td>0.40</td>
<td>1.40</td>
</tr>
<tr>
<td>PFHxS</td>
<td>1.08</td>
<td>1.10</td>
<td>3.70</td>
</tr>
</tbody>
</table>

- For example, if your concentration is higher than the 95th percentile, this means your blood serum is higher than the concentration found in 95% of the U.S. population.

**What blood testing cannot tell you –**

- While exposure to PFAS can increase the risk of certain health effects, a blood test indicating that you have been exposed to PFAS cannot be used to predict whether or not you will experience health effects or if PFAS exposure caused any health problems you may have.
- Test results alone cannot be used to identify specific sources of exposure.
- There is no accepted treatment to reduce levels of PFAS in the blood. Levels decrease slowly over many years when exposure has been reduced or eliminated.

**What are the NJ drinking water standards for PFAS?**

In 2018, NJ became the first state to establish an enforceable drinking water standard for a PFAS chemical when it set a Maximum Contaminant Level (MCL) for PFNA. MCLs for PFOA and PFOS followed in 2020.

<table>
<thead>
<tr>
<th>PFAS</th>
<th>MCL</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFNA</td>
<td>13 ppt</td>
</tr>
<tr>
<td>PFOA</td>
<td>14 ppt</td>
</tr>
<tr>
<td>PFOS</td>
<td>13 ppt</td>
</tr>
</tbody>
</table>

**Abbreviations:** ppt=parts per trillion; ppt = ng/L = nanograms per liter

**NJ MCLS for PFAS**

A maximum contaminant level (MCL) is an enforceable drinking water standard which requires all public water systems to routinely monitor. If levels are found to be above the NJ MCL, the water utility must take actions to reduce levels below the MCL. Available water treatment technologies can effectively reduce levels of PFAS. In many systems that exceeded the NJ MCLs, PFAS have been reduced to nondetectable levels. Your public water utility will monitor and report these levels on a regular basis. Water results are available on NJDEP’s Drinking Water Watch website.

**What are the USEPA Health Advisories and Proposed Regulations?**

The US Environmental Protection Agency (USEPA) issued a non-enforceable drinking water Lifetime Health Advisory in 2016 for PFOA and PFOS of 70 ppt individually or when combined. More recent scientific evidence found that negative health effects can occur at much lower levels for PFOA and PFOS. In June 2022, the USEPA established updated Interim Lifetime Health Advisories and subsequently in March 2023, proposed National Primary Drinking Water Regulations (MCLs) for six PFAS.

<table>
<thead>
<tr>
<th>PFAS Compounds</th>
<th>Proposed MCL</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFOS</td>
<td>4 ppt</td>
</tr>
<tr>
<td>PFOA</td>
<td>4 ppt</td>
</tr>
<tr>
<td>PFNA</td>
<td></td>
</tr>
<tr>
<td>PFHxS</td>
<td>Hazard Index</td>
</tr>
<tr>
<td>PFBS</td>
<td>=1.0</td>
</tr>
<tr>
<td>GenX</td>
<td></td>
</tr>
</tbody>
</table>
The proposed USEPA MCLs of 4 ppt for PFOA and PFOS are set at the USEPA Reporting Levels, which are the levels that laboratory methods can measure PFOA and PFOS in water. The proposed USEPA Maximum Contaminant Level Goals (MCLGs; health-based levels) for PFOA and PFOS are zero.

The Hazard Index approach proposed by USEPA would regulate four additional PFAS as a mixture. USEPA has developed the following Health Based Water Concentrations (HBWCs) for the four PFAS included in the Hazard Index:

- PFHxS – 9.0 ppt
- PFNA – 10.0 ppt
- GenX – 10.0 ppt
- PFBS – 2000.0 ppt

The Hazard Index is calculated by summing the ratios of each individual PFAS measured chemical compared to its HBWC. A water system could exceed the proposed Hazard Index MCL when only one, two, or three PFAS are present. Occurrence of one PFAS above its HBWC would result in an MCL exceedance.

In general, state standards may not be higher (less strict) than federal standards. **If the USEPA adopts the national MCLs, they would replace the NJ MCLs so that the lowest applicable standard is in place.** Once the rules are finalized, water systems would have three years to be in compliance with the MCLs.

**How were the NJ MCLs and USEPA proposed MCLs developed?**

**NJ MCLs –**

The [NJ Drinking Water Quality Institute (DWQI)](http://www.dwqic.org), an advisory body composed of scientists and technical experts from academia, the water industry, environmental health, the NJ Department of Environmental Protection (NJDEP), and the NJ Department of Health (NJDOH) is responsible for developing MCLs and recommending them to the NJDEP. The NJ PFAS MCLs were developed after a thorough review of the scientific information available at the time and are intended to be both health-protective and scientifically supportable.

The NJ PFAS MCLs are based on studies of effects on laboratory animals. These PFAS MCLs are intended to be protective both for cancer (for PFOA and PFOS) and non-cancer health effects. Cancer effects are determined based on a one in a million risk from lifetime water consumption. The non-cancer health effects may occur over a shorter period of time (less than a lifetime) when the PFAS level in water is above the MCL.

**USEPA Proposed National Primary Drinking Water Regulations (MCLs) –**

The proposed USEPA National Primary Drinking Water Regulations (MCLs) for PFOA and PFOS are based on human epidemiology studies that find associations of health effects with exposures to these PFAS in the general population.

Animal studies form the health basis of most federal and state drinking water standards. However, the use of human epidemiology information as the basis of a drinking water standard is preferred when sufficient and high-quality human data are available.

**Understanding the differences between NJ MCLs and proposed USEPA MCLs**

Numerous studies have shown health effects of PFOA and PFOS occur at exposure levels found in the general population. Furthermore, with ongoing exposure to PFOA and PFOS in drinking water at levels even below the NJ MCLs, blood serum concentrations of PFOA and PFOS are expected to substantially increase above general population levels.

The efforts by the USEPA to incorporate the newest science into their proposed standards, including data on health effects in human populations exposed to low levels of PFAS, will result in additional public health protection from exposure to these chemicals in drinking water. If finalized, these MCLs will require NJ drinking water systems to reduce PFAS concentrations to even lower levels in drinking water.
**Recommendations**

PFOA, PFOS, and PFNA build up in the body over time, and it takes many years for the levels of these PFAS in your body to decrease after exposure has ended. Since New Jersey has established MCLs, water systems across the state are taking action to reduce concentrations of these PFAS to levels below the NJ MCLs. Some utilities have achieved non-detectable levels since the NJ MCLs have been in place. You can find more information at the NJDEP website: [dep.nj.gov/pfas/](http://dep.nj.gov/pfas/)

If PFAS are detected in your drinking water:

Some water systems are still working on establishing treatment solutions to reduce PFAS concentration below the NJ MCL. **If you learn that a PFAS is detected in your drinking water supply above a New Jersey MCL, until your water utility has reduced PFAS levels:**

- **For nursing (breastfed) babies:** PFAS are present in breast milk and can be transferred to nursing babies. Despite this exposure, mothers who are breastfeeding should continue to nurse. The extensive information on the health benefits of breastfeeding suggests that benefits of breastfeeding outweigh potential risk of additional PFAS exposure.
- **For all babies:** Bottled water should be used when giving infants just water and preparing juice made from concentrate for infants.
- **For pregnant women, nursing women and women considering or planning on having a child:** Switching to bottled water or using a home water filter for drinking and cooking will reduce PFAS exposure. However, PFAS are slowly excreted from the body. Therefore, risk reduction will not be immediate, as exposure to the fetus and nursing infant is influenced by the mother’s past exposure.
- **For older children and adults:** If a public water utility notifies you that a PFAS exceeds the NJ MCL, they are required to promptly take actions to reduce these levels. Individuals who wish to reduce exposure to PFAS while the water utility is taking actions to reduce levels can consider switching to bottled or home filtered water for drinking and cooking.

**For health care providers:**

Health care providers can find more information on PFAS testing and health outcomes in a recent report by the National Academy of Sciences [Guidance on PFAS Testing and Health Outcomes | National Academies](https://nationalacademies.org).

A summary of the report’s highlights can be found here: [PFAS Guidance Highlights.pdf](https://nationalacademies.org). The report recommends that clinicians discuss the potential benefits and harms of testing for PFAS in blood serum and engage in shared decision making with patients regarding monitoring for commonly associated outcomes including cholesterol and thyroid dysfunction, and screening for signs and symptoms of testicular cancer, ulcerative colitis, and kidney cancer. Additional recommendations from ATSDR are expected.

**For the general population:**

Drinking water is an important exposure source to PFAS. Your public water system is required to monitor for PFOA, PFOS, and PFNA. If results exceed the NJ MCLs, the water utility must inform you. More information on where to find water results are in the section that follows.

Bottled water sold in NJ is required to meet the NJ MCLs. Additionally, some water filters are certified to reduce PFAS concentrations below 20 ppt but these alternative drinking water sources are not ensured to have PFAS concentrations lower than the NJ MCLs. More information on where to find out about bottled water monitoring and home water filters can be found on Page 5.

Anyone concerned about their health should consult with their personal health care provider.
Did You Know?

Bottled water sold in NJ is regulated by the NJ Department of Health and is required to meet Safe Drinking Water standards. N.J.A.C. 8:21-5.1 et. seq

How can I find out if PFAS are detected in my drinking water?

- **Public Water Users**
  
  NJ public water systems were required to begin monitoring for PFNA in 2020 and for PFOA and PFOS in 2021. These results are available on NJDEP’s Drinking Water Watch website. This is a database that is searchable by water system ID number, system name, or (if you don’t know the ID number or name) by county and municipality, to identify all systems serving that area. Information on which utilities serve your area can also be found at this site.

  Some water systems have earlier results through the EPA Unregulated Contaminant Monitoring Rule (UCMR3). These UCMR3 results were reported in your annual Consumer Confidence Reports (CCRs) which may be available online or mailed to your home directly by your water provider. CCRs are also found on NJDEP Drinking Water Watch. UCMR5, which began in Jan. 2023 and is testing all PWS with >3300 users for 29 PFAS at low Reporting Levels and results will be reported as they become available.

  Additionally, a list of public water systems with PFOA, PFOS, and/or PFNA MCL violations is available here - bit.ly/PFASDataMiner

- **Private Well Users**
  
  PFNA, PFOA, and PFOS have been added to the NJ Private Well Testing Act (NJ PWTA). The NJ PWTA is a consumer information law established in 2002 that requires private wells to be tested for a list of contaminants by a certified laboratory during real estate transfer. It also requires landlords to test well water supplied to tenants every five years and provide the results. The addition of PFAS to the NJ PWTA means that private wells at homes being sold in NJ were tested for these three PFAS (and other listed contaminants) starting December 1, 2021.

  Well owners who are not selling their home may wish to contact a certified laboratory to have their well water tested. To find a list of certified laboratories visit NJDEP DataMiner: njems.nj.gov/DataMiner/[Search by Category > Certified Laboratories > Scroll to “PFAS Drinking Water Certified Laboratories”]

How do I know that my bottled water does not exceed the NJ drinking water standards for PFAS?

Companies that sell bottled water in NJ were required to analyze for PFNA, PFOA, and PFAS annually. Bottled water companies are required to submit their annual monitoring results to NJDOH with the application for their annual license. More information on NJ’s Bottled Water Program can be found here: nj.gov/health/ceohs/documents/phfpp/BWStandards.pdf

Where can I get more information about home water filters?

Water treatment devices utilizing granular or powdered activated carbon filters, reverse osmosis, ion exchange resins and other specialized treatment media are technologies that can reduce the level of PFAS in drinking water. If a water treatment device is used, it is important to follow the manufacturer’s guidelines for maintenance and operation.

NSF International, an independent and accredited organization, certifies products proven effective for reducing PFOA and PFOS below the USEPA Health Advisory of 70 ppt (2020 standard version). Recently, the standards have been updated to more stringent levels below 20 ppt (2022 standard version). When purchasing a filter, verify that the product is NSF/ANSI standard 53 and check for the standard version to know at which level the filter is certified to remove total PFAS (PFOA, PFOS, PFNA, PFHxS, PFHpA).

Please note, these products are not certified for removal to the lower NJ MCLs of 14 and 13 ppt or the lower USEPA proposed MCLs.
**Additional Questions**

If high levels of PFAS were detected in my water, how will it affect fruits and vegetables in my garden?

For gardening or farming, certain plants may take up some PFAS from irrigation and soil. Unfortunately, there is not enough scientific data to predict how much will end up in any specific crop. For most people the risk from the occasional consumption of produce grown in soil or irrigated with water contaminated with PFAS is likely to be low. For families who grow a large fraction of their produce, the risk of exposure to PFAS may be higher and they can consider the following steps:

- Maximize use of water from an uncontaminated source for your garden.
- Wash your produce in clean water after you harvest it.
- Modify your soil with clean compost. Increasing the organic content of your garden soil can prevent the uptake of PFAS into plants.

If PFAS are present above the NJ MCL, what water should I give my pets?

Scientists are not certain of the health impacts to pets. If you are concerned, you may choose to give your pet bottled or filtered water until your water utility has reduced the concentrations of PFAS in the drinking water below the NJ MCL.

**If PFAS are present above the NJ MCL, what water should I use in my humidifier?**

In line with USEPA recommendations, bottled water or home filtered water should be used in your humidifier until levels of PFAS in your drinking water are reduced.

**What water should I use in my continuous positive airway pressure (CPAP) machine?**

Individuals should continue to follow existing medical guidance regarding the use of distilled water in CPAP machines as instructed by the manufacturer and their doctor.
