New Jersey Chartbook of Substance Abuse Related Social Indicators

Gloucester County

May 2013
Acknowledgements

We wish to gratefully acknowledge the contribution of public agencies for providing us with archival data on which this study is based. The selection of indicators, the collection and presentation of data, and the specific notes on interpretations were developed through a collaborative effort between Rutgers School of Social Work, the Division of Mental Health and Addictions Services (DMHAS), New Jersey Department of Human Services (NJDHS) and the New Jersey State Epidemiological Outcomes Workgroup (SEOW).

We would like to thank the entire Rutgers University and DMHAS team who worked on this Chartbook project: Cory Morton, Ph.D., Kristen Gilmore Powell, Ph.D., N. Andrew Peterson, Ph.D., Christopher J. Kok, Cailean Carr, Kristin Lepping, Clare F. Neary, M.S., Gary Barrett, Suzanne Borys, Ed.D., Donald Hallcom, Ph.D., and Yohannes Hailu, Ph.D.

This Chartbook was developed under the New Jersey Strategic Prevention Enhancement (SPE) grant (SP018629-01) from the Substance Abuse and Mental Health Services Administration (SAMSHA), U. S. Department of Health and Human Services (HHS).

Introduction

Assessing the well-being of community health through social indicators has been a long-standing concern to the Center for Substance Abuse Treatment (CSAT). To meet this objective, CSAT has encouraged the use of social indicators to assess social and health risks related to substance misuse in order to inform policy makers. CSAT convened a group to draft a road map for such studies in the form of a “Social Indicators Core Protocol” to be used by states. Following the social indicators core protocol guidelines provided by CSAT, the Division of Mental Health and Addiction Services (DMHAS) developed this Chartbook of substance abuse related social and health indicators in the state of New Jersey.

The Social Indicators Chartbook is intended to identify social and health problems directly or indirectly related to substance use and to aid in the assessment of needs for treatment and prevention services. This is achieved, in part, by using key social indicators outlined in the core protocol by CSAT, and by identifying risk and protective factors affecting health outcomes. Summary analysis of the core indicators is presented using census data, criminal justice data and substance abuse treatment admissions data. Additional indicators were identified using guidance from three sources: 1.) The U.S. Department of Health and Human Services Substance Abuse and Mental Health Services Administration’s Risk and Protective Factors for Mental, Emotional, and Behavioral Disorders Across the Life Cycle; 2.) The Community Anti-Drug Coalition’s (CADCA) Assessment Primer: Analyzing the Community, Identifying Problems and Setting Goals; and 3.) CADCA’s Community Assessment Needs Assessment Data Collection Examples of Local Data worksheet. These documents rely on the Center on Substance Abuse Prevention’s (CSAP) Strategic Prevention Framework to guide the identification of individual, family, and community factors that are related to substance abuse. Additionally, CADCA’s Assessment Guide is specifically concerned with aiding community coalitions during the needs assessment process and in identifying communities to target for prevention initiatives and the organization of the county and municipal social indicators follow CADCA’s conceptualization of domains useful in prevention planning.

The specific objectives of the Chartbook are to:

- Present an objective profile of New Jersey at the state, county, and municipal levels using key social indicators related to substance abuse. The Chartbook incorporates indices of core indicators based on historical data sources on population, arrests, and substance abuse treatment admissions. In addition, indicators of risk and protective factors that affect health outcomes are presented for each county and the State.
- Show the effect of substance use and related health consequences in New Jersey at the state, county, and municipal levels.
- Provide information to support needs assessment and prevention, as well as treatment planning, at the community level.
Data Sources

Data for the social indicators core protocol and supplemental indicators were obtained from archival sources published by the U.S. Bureau of the Census and New Jersey governmental agencies, including the Departments of Human Services, Health, and Law and Public Safety. Data are also obtained from DMHAS’ Substance Abuse Monitoring System and from DMHAS-sponsored needs assessment surveys. An outline of the data sources used for the chartbooks is included in Appendix C.

Report Organization

The Chartbook includes three main chapters: The State Profile of Social Indicators, County Profile of Social Indicators and Municipal Profile of Social Indicators. Selected indicators are displayed using thematic maps, charts and tables accompanied with brief descriptive text. The maps display patterns of specific health indicators of each county and the tables provide recent, as well as trend, data on selected indicators.

Each Profile of Social Indicators details three areas including population characteristics, criminal justice data (alcohol and drug attributable crime), and alcohol and drug treatment admissions by modalities and by drug of abuse (alcohol, heroin, cocaine/crack, marijuana and other drugs).

Appendices A and B present raw data, which are associated with the data summaries presented throughout the Chartbook. These raw data tables can be used for prevention and treatment planning and are grouped according to the definitions used by Community Anti-Drug Coalitions of America (CADCA) in the types of data that are useful for community coalitions and prevention agencies to use in needs assessment planning. These include: Substance Abuse Consequences, Substance Abuse Problems, Root Causes of Substance Abuse, Local Conditions, and Demographic Profile. The organization of the Chartbook aligns with the work that many coalitions and agencies are undertaking within the Strategic Prevention Framework (SPF). These domains, such as consequences and root causes, are elements of the SPF and other public health or science-based models guiding substance abuse prevention efforts.

Appendix C contains a full list of references as well as descriptions and calculations for all of the data contained within Appendices A and B. Appendix C is organized in accordance with Appendices A and B and it is to be used in conjunction with these appendices to detail both the source of the data and how data were calculated. Appendix C also provides critical details about the conceptualization and measurement of the variables in Appendices A and B.

- Substance Abuse Treatment Admissions Data
Population Profile

Introduction

This section describes the population characteristics of New Jersey in order to provide a context for analyzing and interpreting the social indicators that have potential effects on health status, treatment needs and type of treatment services provided. Population characteristics are of fundamental importance in estimating prevalence rates or in age-adjusting data when comparing indicators across counties. Data on population change, gender, age, race and ethnicity are obtained from the 1990, 2000, and 2010 decennial censuses.

General Profile of Census Population Data & Population estimates

- Population Growth (1980-2010)
- Age Structure
- Population Distribution by Age
- Population Distribution by Age and Gender
- Population Distribution by Race and Hispanic Origin

### Population Profile, 2010

- **Total population:** 8,791,894
- **Density / Sq. Mile:** 1,196
- **Median age:** 39.0

#### Age Distribution:
- 0-11 years old: 15.2%
- 12-17 years old: 8.2%
- 18-64 years old: 63.0%
- 65 years & over: 13.5%

#### Race/Ethnicity Composition
- One race: 97.3%
  - White: 68.6%
  - African American: 13.7%
  - American Indian: 0.3%
  - Asian: 8.3%
  - Other: 6.4%

- Two-or-more Races: 2.7%
- Hispanic or Latino: 17.7%
Population Growth

- According to the 2010 Census, New Jersey’s total population reached 8,791,894 people, which makes it the 11th most populous state in the United States. The increase of 377,544 residents in the state since the 2000 Census represents a lower rate of growth (4.5%) than that of 1990-2000 (8.9%) and 1980-1990 (5.0%).
- For the last four decades, the state had a significantly slower population growth compared to national data and its share of the nation’s population declined from 3.5% in 1970 to 2.8% in 2010. Despite a slower growth, New Jersey remains the most densely populated state in the U. S. (1,189 people per square mile).
- From 2000 to 2010, ten counties in New Jersey experienced higher than the statewide growth: Gloucester (13.2%), Ocean (12.9%), Somerset (8.7%), Atlantic (8.7%), Middlesex (8.0%), Cumberland (7.1%), Warren (6.1%), Burlington (6.0%), Hunterdon (5.2%), and Morris (4.7%).
- The northeastern counties (Bergen, Essex, Hudson, Passaic, and Union) experienced population decline in the 1980s (-2%). However, this region’s total population increased 6.9% from 1990-2000 and 2.1% from 2000-2010 which was the lowest as a region in New Jersey.
- Rural northwestern counties (Sussex & Warren) (4.8%) and the coastal region (Atlantic, Cape May, Monmouth, and Ocean) (4.8%) both experienced moderate population growth.
- Population growth in the southern counties (Burlington, Camden, Gloucester, and Salem) (5.7%) was the highest as a region in the state of New Jersey.
In general, differences in age distribution between groups reflect differences in death rates, fertility rates, and rates of net migration. It also contributes to differences in social, health, and economic status across population groups. Census 2010 shows the progression of four major age-profile variations. Sequentially, they have assumed the widely used label of the depression era birth dearth, post-World War II baby boom, the baby bust, and the baby-boom echo. The dominant features in the Census 2010 landscape are: the 45-64 year old baby boom generation, the 15-29 year old baby-boom echo, and the 30-44 year old baby bust.

- The baby boom generation moved into the 45-64 years-old sector in 2010 and accounted for 26.8% of New Jersey’s population. 2.4 million out of 8.9 million people are in the baby boomer cohort. During the 2000’s the 45-54 years-old sector grew by 19.0%, while the 55-64 year-old age group grew by 38.8%. As baby boomers age and enter the older adult and elderly age groups, the sheer size of this generation creates pressure on New Jersey’s infrastructure and social services.

- The baby bust generation\(^1\) (30-44 years old) accounts for 20.4% of the population in 2010. Within this age group, the 30-34 year-old group shrank by 13.6% and the 35-44 year-old group by 13.7%.

- The generation known as the baby-boom echo, Generation Y, or the Millennials\(^2\) is presently reflected in the sharp growth of the 15-29 year-old age group. The 15-19 year-old population grew by 13.9% while the 20-29 year old group grew by 12.4%. Thus, after a period of decline, the number of teenagers and young adults shows higher growth in 2010. These cohorts may challenge prevention services in the current decade as they enter adulthood since a large proportion of treatment populations fall in these age groups.

- In 2010, the total number of the elderly population (65 years of age and over) growth rate slowed down as compared to 2000. The growth rate was 6.5% in 2010 compared to 7.9% in 2000. The elderly account for 13.5% of the total population in 2010. Between 2000 and 2010, the 65-74 year old group increased by 6.4% while the 75-84 year old group declined by -1.9%. The 85+ year old group saw the second highest growth rate in 2010 at 32.1%.

- The size of the 55-64 year old age group saw the greatest increase in size in 2010 at 38.8% which was a marked difference from the growth rates of 9.3% in 1990 and 8.8% in 2000.

- The median age of New Jersey’s population increased from 34.4 years in 1990 to 36.7 years in 2000 to 39.0 in 2010. Among the counties in New Jersey, the median age is highest in Cape May (47.1 years) followed by Hunterdon (43.5 years). Hudson County is the youngest county (34.2 years) followed by Passaic (36.1 years).

---

1 The baby bust generation is an undersized population cohort produced during the low-birth era from 1965 to 1976.

The racial and ethnic changes resulting from the twentieth-century immigration pattern is firmly embedded in New Jersey’s population profile. According to Census 2010, the foreign born population is approximately 20%, which is far greater than the 1970s (10%) but still below that of 1910 (25%). The new diversity of immigration observed during the last 45 years demonstrates that the dominance of the European foreign born population has been replaced by the foreign born population from Latin America and Asia. As shown in the table below, this resulted in the explosive growth of Asians (51.1%) and Hispanics (39.2%), compared with 4.5% for the overall population. New Jersey’s white population decreased by 1.2%, while the population of African Americans grew by 5.5%.

Asians are the fastest growing racial group in New Jersey. More than one in two (53.3%) of New Jersey’s Asians are concentrated in three counties: Middlesex (172,534), Bergen (130,491) and Hudson (83,825). Among Asians, Asian Indians were the fastest growing group during the 2000s. The number of Asian Indians grew 72.7% from 169,180 in 2000 to 292,256 in 2010. Chinese are the second largest Asian group in New Jersey with a total population of 134,442.

Hispanics accounted for more than a third (39%) of the state’s population growth in the past decade. More than one-third (39.4%) of the State’s Hispanic population resided in Hudson, Passaic, and Essex counties. Newark City, Paterson, Elizabeth, Jersey City, and Union City had the largest Hispanic populations in 2010 in terms of gross numbers while West New York, Union City, Perth Amboy, North Bergen, and Passaic had the highest percentage of total municipality Hispanic population in 2010.

Criminal Justice Data: Alcohol and Drug Crime Indicators

Introduction

This section presents alcohol and drug-related crime indicators drawn from the Uniform Crime Report (UCR) for New Jersey. It should be noted that the UCR has limitations with respect to coverage and with respect to the accuracy in reflecting the amount of alcohol and drug involvement in reporting crimes. Alcohol and drug attributable crime is calculated by applying alcohol and drug attributable fractions (ADAF) to the counts of arrests/criminal offenses. These fractions were developed by the National Institute on Drug Abuse (1992) through interviews and surveys of inmate populations on the use of alcohol and drugs in concert with criminal activity.

Crime data attributable to alcohol and drugs, New Jersey, 2010

- Number of alcohol-related arrests and arrest rates by type of offense in New Jersey
- Number of drug-related arrests and arrest rates by type of offense in New Jersey
**Highlights**

- There were 45,556 alcohol-related arrests and 63,395 drug-related arrests in New Jersey in 2010.

- The alcohol-related arrest rate for New Jersey in 2010 was 676 arrests per 100,000 inhabitants. The major contributing factors to alcohol-related crimes were Driving Under the Influence (303 per 100,000), other assaults (92 per 100,000), and liquor laws (79 per 100,000).

- The drug-related arrest rate for New Jersey in 2010 was 721 arrests per 100,000 inhabitants. The major contributing factors to drug-related crimes were drug abuse violations (568 per 100,000), larceny-theft (91 per 100,000), and burglary (21 per 100,000).

- Among New Jersey’s counties, the top 5 alcohol arrest rates in 2010 were in Cape May County (1,560 per 100,000), Cumberland County (843), Atlantic County (836), Gloucester County (761), and Salem County (751).

- The top 5 drug-related arrest rates in 2010 were in Essex County (1,237 per 100,000), Mercer County (1,092), Cumberland County (1,086), Cape May County (1,074), and Camden (1,011).
The two maps display total arrest rates for 2010.

Substance Abuse Treatment Admissions

Introduction

Substance abuse treatment admission indicators presented in this section are based on data from New Jersey Substance Abuse Monitoring System (NJSAMS) maintained by the Division of Mental Health and Addiction Services, New Jersey Department of Human Services (DMHAS). Profiles of clients served are presented by primary substance of abuse, by modality, and by demographics.

Treatment Admissions

- Treatment admissions by primary substance of abuse in New Jersey
- Residential treatment admissions by modality of care in New Jersey
- Outpatient treatment admissions by modality of care in New Jersey
- County share of admissions by primary drug
Highlights

- Heroin/Other Opiates (42%) and Alcohol (32%) were the primary substances of abuse for those presenting for substance abuse treatment in New Jersey.

- Outpatient treatment accounted for 58% of all substance abuse admissions for New Jersey in 2011 and among outpatient treatment types, general Outpatient Treatment and Intensive Outpatient were the primary treatment modalities.

- Residential treatment accounted for 38% of all substance abuse admissions for New Jersey in 2011 and among residential treatment types, Residential Detox and Short-Term Residential were the primary treatment modalities.

- Substance abuse treatment clients in New Jersey were 63% White, 22% African American, and 14% Latino.

- Among New Jersey’s counties, Monmouth (7,338), Ocean (6,734), Essex (6,677), Camden (5,893), and Middlesex (4,705) had the highest total substance abuse treatment admissions. In terms of the rate of substance abuse treatment admissions per 100,000 residents, Cape May (2,012), Atlantic (1,399), Cumberland (1,238), Ocean (1,168), and Monmouth (1,164) had the highest rates of substance abuse treatment admissions.

- For treatment admissions with alcohol as the primary substance of abuse, Monmouth (2,707), Ocean (2,056), Middlesex (1,624), Essex (1,489), and Hudson (1,342) had the highest total admissions. In terms of the rate per 100,000, Cape May (610), Warren (443), Monmouth (429), Cumberland (401), and Hunterdon (395) had the highest rates of admission with alcohol as the primary substance of abuse.

- For treatment admissions with any drug as the primary substance of abuse, Essex (5,188), Ocean (4,678), Monmouth (4,631), Camden (4,557), and Middlesex (3,081) had the highest total admissions. In terms of the rate per 100,000, Cape May (1,042), Atlantic (1,027), Camden (887), Cumberland (837), and Gloucester (830) had the highest rates of admission with any drug as the primary substance of abuse.

Chapter Two

County Profile of Social Indicators
Introduction

The County Profile of Social and Health Indicators is derived from archival sources published by the U.S. Bureau of the Census and New Jersey governmental agencies, including the Departments of Human Services, Health, Education, and Law and Public Safety. Data are also obtained from DMHAS’ Substance Abuse Monitoring System. Appendix A presents data at the county level for the substance abuse indicators summarized in this chapter and includes more data on consequences of substance abuse, root causes of substance abuse, local conditions, and demographics.

Population:
• Population size, growth, and crime rate by county and municipality
• County demographic characteristics (age, race, density and poverty level)

Criminal Justice Data:
• Alcohol related crime by age and by type of offences
• Drug related crime by age and by type of offences

Substance Abuse Treatment Admissions Data:
• Substance abuse treatment admissions by primary substance of abuse
• Substance abuse treatment admissions by modality of care
### Gloucester County Demographic and Social Indicator Profile

**General Profile**

- **Demographics 2010:**
  - Population size: 288,288
  - Density / Sq. Mile: 857.2
  - Median Income: 72,664
  - 18 years old and over (%): 75.6
  - 65 years old and over (%): 12.4
  - Total Crime Rate (per 1,000): 29.0
  - TANF Rate (per 1,000): 3.8

- **Substance Abuse Treatment Admissions/1,000:**
  - Alcohol: 3.1
  - Drugs: 8.3

- **Arrest Rates/1,000 Attributable To:**
  - Alcohol: 7.6
  - Drug: 7.8

- **Child Abuse and Neglect (CAN):**
  - CAN Investigation Rate (per 1,000): 57.0
  - CAN Substantiation Rate (per 1,000): 5.6

Chapter Three
Municipal Profile of Social Indicators
Gloucester County
This chapter provides detailed data for each of the county municipalities. This section provides a discussion of the interesting aspects of the municipal data from a broader, statewide perspective. For some of the key indicators, a summary statistics table shows the municipalities that had the maximum and minimum values, the median or central value, along with the statewide total or average values.

As can be gauged from the table on the next page, there is significant variation among the municipalities on each of the indicator variables. A statewide value for an indicator significantly different from the median value suggests a notable skew in the data for that indicator variable. For instance, the median value for Drug Arrests/1,000 population is 4.4, while the statewide rate is 7.2. This indicates that the statewide average is being strongly affected by relatively few municipalities. In other words, even though half of the communities have rates of 4.4 or lower (by definition of the median value), there are a few communities with rates high enough to raise the statewide average almost two-fold. Another indication of this data skew can be inferred by the distribution of total number of drug arrests among the municipalities above the median. For example, almost half of all the drug arrests (24,467 of the total 52,088) were made in 15 municipalities.

Some care should be taken in interpreting the data presented in the chartbook. Some of the extreme values listed are found in very small communities where small base numbers or small populations can yield high rates. For example, the Teterboro municipality has a high domestic violence rate of 388.9 per 1000, but this was calculated using the municipality’s population of 18, and involved seven reported incidents.

Also, note that for some indicator variables a large visitor population can generate extreme rates. For example, highest non-violent and total crime rates were found in Atlantic City and Wildwood, respectively – both shore towns. When the crime numbers are turned into rates, based on resident population, the large flux of visitors is not taken into account. Visitors are involved, both as victims and as perpetrators, but they are not taken into account when measuring the prevalence of crime per capita. Therefore, to avoid misunderstanding/misuse, it is important to keep these limitations of data indicators in mind while interpreting the significance of their values.

The rest of this section reviews interesting variations and highlights for different indicators. This municipality-based perspective is very useful in understanding the dynamics of the wide cross-section of communities in the State of New Jersey.

\(^4\)Rutgers Continuing Studies’ Center for Government Services (2010) Legislative Data Book
Race and Ethnicity
From 1990-2010, the percentage of Whites decreased by 10% and there was a considerable increase in the Asian and Hispanic or Latino categories (almost doubled).

Racial and Ethnic Composition, New Jersey 1990-2010 (%)
Poverty

The statewide 2010 poverty data showed an average poverty rate of 7.0%, compared to 8.9% in 2000. The New Jersey poverty rate also compares favorably to the national rate of 10.5%. Ninety-eight municipalities in New Jersey had a poverty rate above the national average. The number of municipalities with poverty rate less than 3% decreased from 191 municipalities in 1990 to 139 municipalities in 2000 and to 107 municipalities in 2010.

Additionally, the poverty rates vary significantly between the various races/ethnicities. The poverty rates by race/ethnicity for the years 1990-2010 are shown in the figure below. African American and Hispanic populations show the highest poverty rates, about three times that of the White population. However, poverty has seen small decreases among African Americans, Asians, people reporting two or more races, and Hispanics while Whites have seen increases in poverty from 1990.

Poverty by Race, New Jersey 1990-2010 (%)

* The racial category, Other, was combined with Asian in poverty tables in 1990. New racial and ethnic response options were added with the 2000 Census.
Median Income

The Median Household Income of New Jersey in 2010 was $71,180, compared to the National Median of $52,762. It is worth mentioning that 329 municipalities (out of 566) had median household income above the state median level. Also, only 69 municipalities in New Jersey had a median income less than the national median household income. The percentages of municipalities above and below the Median Household Income for New Jersey are shown in the figure below.

Percentage of New Jersey Municipalities Above or Below Median Household Income, 1990, 2000, and 2010
Substance Abuse Treatment Admissions

Alcohol and Drug Treatment Admission is an indirect measure of the substance abuse problem at a community level. As the data within this chartbook will demonstrate, substance abuse problems are not exclusively limited to a few communities alone. Even so, the distribution is clearly skewed. Concurrent with this observation, the top 10 communities represented 24.97% of all substance abuse treatment admissions in 2011. Newark City (n=3,685), Jersey City (2,479), Paterson City (1,895), Camden City (1,874), and Elizabeth City (1,466) were the five municipalities with highest treatment admissions in terms of raw numbers.

The total number of statewide alcohol treatment admissions was 16,152 in 2000 (a drop of almost 47% compared to 1992), but rose again in 2011 to 23,669 (a gain of 46% compared to 2000). Alcohol treatment admissions were the highest in the five following municipalities: Jersey City, Newark, Trenton, Paterson, and Elizabeth. For drug treatment, admissions in 2000 for all types of drug abuse treatment was 38,756 and by 2011 had risen to 49,088, an increase of 27%. The municipalities with the highest numbers of drug treatment admissions were Newark, Jersey City, Paterson, Atlantic City, and Elizabeth. Statewide trends in admissions are shown below in terms of the rate per 100,000 for total admissions, alcohol admissions, and drug admissions.

Substance Abuse Treatment Admissions Rate per 100,000: 2000, 2006-2011

![Graph showing trends in Substance Abuse Treatment Admissions Rate per 100,000: 2000, 2006-2011]

Alcohol and Drug Attributable Crime

Another indirect measure of substance abuse dependence and problems is the amount of crime that can be attributed to use of alcohol and drugs. Note here that these values are impacted by the intensity of enforcement and should be considered as only a partial indicator of drug abuse prevalence. Alcohol and Drug Attributable crime reflect crimes that occur as a direct result of substance use (i.e., DUI, Liquor Law Violation, Drug Abuse Violation) as well as by calculating the percentage of other crimes (i.e., homicide, larceny, motor vehicle theft) that can be considered attributable to substance use. The National Institute on Drug Abuse established the Alcohol and Drug Attribution Factors (ADAF) through surveys with inmates on what percentage of crimes were associated with alcohol and drug use. The ADAF is applied to the total counts of crime to produce estimates of alcohol and drug attributable crime.

Despite this limitation of this indirect measure, it is a helpful tool in gauging the extent to which collateral problems are associated with substance abuse. In the tables that follow, it is clear that communities with high numbers of alcohol and drug attributable criminal offenses are also suffering from some of the state’s highest poverty rates. This strong convergence of different indicators could be useful in making informed policy interventions and undertaking resource allocation decisions.

*NJASK and HSPA Indices*

The New Jersey Assessment of Skills and Knowledge (NJASK) and High School Proficiency Assessment (HSPA) are operational assessments which consist of three content areas for Grades 4, 8, and 11: Language Arts Literacy, mathematics, and science. This assessment is given to indicate the progress students are making in the 3 content areas and as a requirement of the No Child Left Behind Act of 2001 ([http://www.nj.gov/education/assessment/es/njask_tech_report11.pdf](http://www.nj.gov/education/assessment/es/njask_tech_report11.pdf)).

The NJASK and HSPA indices show the performance of pupils on the three tests. In each case the mean average scores on each part of the test have been indexed with 1.000 representing a perfect score, and the indexes for the various parts of the test have been averaged (Legislative Data Book, 2010).

*NJASK and HSPA Indices

The New Jersey Assessment of Skills and Knowledge (NJASK) and High School Proficiency Assessment (HSPA) are operational assessments which consist of three content areas for Grades 4, 8, and 11: Language Arts Literacy, mathematics, and science. This assessment is given to indicate the progress students are making in the 3 content areas and as a requirement of the No Child Left Behind Act of 2001 (http://www.nj.gov/education/assessment/es/njask_tech_report11.pdf).

The NJASK and HSPA indices show the performance of pupils on the three tests. In each case the mean average scores on each part of the test have been indexed with 1.000 representing a perfect score, and the indexes for the various parts of the test have been averaged (Legislative Data Book, 2010).

Appendix C: Data Sources and Calculations
Data Sources and Calculations: County

I. Consequences of Substance Abuse

A. Crime: Rate calculated as the number of arrests per 100,000 residents

Alcohol and drug attributable crime is calculated by applying alcohol and drug attributable fractions (ADAF) to the counts of arrests/criminal offenses. These fractions were developed by the National Institute on Drug Abuse (1992) through interviews and surveys of inmate populations on the use of alcohol and drugs in concert with criminal activity. A detailed explanation of this methodology can be found here: http://archives.drugabuse.gov/EconomicCosts/Chapter6.html#6.2

Alcohol related motor vehicle accidents: Rate calculated as the number of accidents per 1,000 residents aged 16 and over

Rutgers University Center for Advanced Infrastructure and Transportation. (2009). Alcohol related motor vehicle accidents [data file].

Alcohol related motor vehicle accidents are defined as those where a driver was suspected of drinking and the officer indicated the crash was alcohol-related, and, consistent with prior research, single passenger vehicle nighttime accidents occurring between 8pm and 4am and any accident between 8pm and 4am involving a fatality (Treno, Johnson, Remer & Gruenewald, 2007; Gruenewald & Ponicki, 1995; Holder & Wagenaar, 1994).

B. Dependence: Number and percentage of substance abuse treatment admissions

II. Substance Abuse Problems

A. Current Use: Percentage of respondents who answered affirmatively to substance use items

Middle School Use

High School Use
Adult Use

B. Binge Drinking: Percentage of respondents who answered affirmatively to substance use items

Middle School Use

Adult Use

C. Age at First Use: Percentage of respondents who answered affirmatively to substance use items

III. Root Causes

A. Retail Availability: Total number of alcohol and tobacco licenses and the number of licenses per 1,000 residents

New Jersey Department of Law & Public Safety, Division of Alcoholic Beverage Control. (2009). Listing of licensed alcohol retailers [data file].

New Jersey Department of the Treasury, Division of Taxation. (2010). Listing of cigarette retailers [data file].

B. Social Availability

C. Norms Favorable to Substance Use

Private Property Ordinances: Percentage of municipalities with a private property ordinance

Alcohol & Tobacco Outlets Within Walking Distance to Schools

New Jersey Department of Law & Public Safety, Division of Alcoholic Beverage Control. (2009). Listing of licensed alcohol retailers [data file].

New Jersey Department of the Treasury, Division of Taxation. (2010). Listing of cigarette retailers [data file].

Number of alcohol and tobacco outlets within walking distance to schools was calculated by counting the total number of outlets within .5 mile from any K-12 school. The total counts reflect overlap as outlets can be within more than one .5 mile buffer from a school. The average number of outlets was calculated by dividing the total number of outlets within .5 mile from any school by the total number of schools in each county.

IV. Local Conditions

A. Community Environment: Note: Population totals in the American Community Survey will not match the population totals from the US Census, as such, there will be a discrepancy between total population used here and those in the Demographic Profile.

B. Family Structure

Household Data, Male to Female Ratio, Child to Adult Ratio, Birth Rate Among Women Aged 15-50

Domestic Violence: Rate per 1,000

Child Abuse and Neglect, Children in Out-of-Home Care, Teen Age Birth Rate, Infant Mortality

C. School Environment

High School and College Graduation Percentages, College Age Resident Percentage

Other School Indicators: High School Drop Outs 2009-2010, Average Daily School Attendance Percentage, 4th/8th Grade NJASK Index, 11th Grade HSPA Index, School Completion Rate 2005-2009

NJASK and HSPA Indices

The New Jersey Assessment of Skills and Knowledge (NJASK) and High School Proficiency Assessment (HSPA) are operational assessments which consist of three content areas for Grades 4, 8, and 11: Language Arts Literacy, mathematics, and science. This assessment is given to indicate the progress students are making in the 3 content areas and as a requirement of the No Child Left Behind Act of 2001 (http://www.nj.gov/education/assessment/es/njask_tech_report11.pdf). The NJASK and HSPA indices show the performance of pupils on the three tests. In each case the mean average scores on each part of the test have been indexed with 1.000 representing a perfect score, and the indexes for the various parts of the test have been averaged (Legislative Data Book, 2010).

High School Completion Rate

Calculated by dividing the number of 2009 high school graduates by the estimated 2005 total ninth grade enrollment.

D. Peer Behavior

E. Substance Abuse Related Problems

ER Admissions

Substance related ER Admissions were calculated using the Alcohol and Drug Associated Fraction (ADAF) (Harwood, et al., 1998). The ADAF was applied to the actual counts in order to derive the numbers in the tables. Rates are per 100,000 residents.

F. Health Care Access: The number of public health and hospital facilities per 100,000 residents.

G. Substance Abuse Prevention Access, 2012

The number of organizations providing substance abuse prevention programming, number of programs focusing on alcohol, drugs, or tobacco, and the prevention strategy used. These data were merged from several sources: through an online survey of prevention professionals in New Jersey, the Governor’s Council on Alcoholism and Drug Abuse Municipal Alliance reporting data, and data on federal and state funded prevention programming in New Jersey. These data are presented as total counts in the chartbook. Please note that one program can focus on more than one substance of abuse and have more than one strategy.

V. Demographic Profile

Data Sources and Calculations: Municipality

I. Substance Abuse Consequences

A. Crime: Rate calculated as the number of arrests per 100,000 residents

Alcohol and drug attributable crime is calculated by applying alcohol and drug attributable fractions (ADAF) to the counts of arrests/criminal offenses. These fractions were developed by the National Institute on Drug Abuse (1992) through interviews and surveys of inmate populations on the use of alcohol and drugs in concert with criminal activity. A detailed explanation of this methodology can be found here: http://archives.drugabuse.gov/EconomicCosts/Chapter6.html#6.2

Alcohol related motor vehicle accidents: Rate calculated as the number of accidents per 1,000 residents aged 16 and over

Rutgers University Center for Advanced Infrastructure and Transportation. (2009). Alcohol related motor vehicle accidents [data file].

Alcohol related motor vehicle accidents are defined as those where a driver was suspected of drinking and the officer indicated the crash was alcohol-related, and, consistent with prior research, single passenger vehicle nighttime accidents occurring between 8pm and 4am and any accident between 8pm and 4am involving a fatality (Treno, Johnson, Remer & Gruenewald, 2007; Gruenewald & Ponicki, 1995; Holder & Wagenaar, 1994).

B. Dependence: Number and percentage of substance abuse treatment admissions

II. Substance Abuse Related Problems

Current Use, Binge Drinking, Age at First Use: Municipal-level data not available

III. Root Causes

A. Retail Availability: Total number of alcohol and tobacco licenses and the number of licenses per 1,000 residents

New Jersey Department of Law & Public Safety, Division of Alcoholic Beverage Control. (2009). Listing of licensed alcohol retailers [data file].

New Jersey Department of the Treasury, Division of Taxation. (2010). Listing of cigarette retailers [data file].
B. **Social Availability**

Municipal-level data not available

C. **Norms Favorable to Use**

*Private Property Ordinances:* Municipality has private property ordinance: YES, NO, NR=No Response to survey

*Alcohol & Tobacco Outlets Within Walking Distance to Schools*

New Jersey Department of Law & Public Safety, Division of Alcoholic Beverage Control. (2009). Listing of licensed alcohol retailers [data file].

New Jersey Department of the Treasury, Division of Taxation. (2010). Listing of cigarette retailers [data file].

Number of alcohol and tobacco outlets within walking distance to schools was calculated by counting the total number of outlets within .5 mile from any K-12 school. The total counts reflect overlap as outlets can be within more than one .5 mile buffer from a school. The average number of outlets was calculated by dividing the total number of outlets within .5 mile from any school by the total number of schools in each county.

IV. **Local Conditions**

A. **Community Environment** Note: Population totals in the American Community Survey will not match the population totals from the US Census, as such, there will be a discrepancy between total population used here and those in the Demographic Profile.

B. **Family Structure**

Household Data, Male to Female Ratio, Child to Adult Ratio, Birth Rate Among Women Aged 15-50, Teen Age Birth Rate

C. School Environment

High School and College Graduation Rates, College Age Residents

Other School Indicators: High School Drop Outs 2009-2010, Average Daily School Attendance Percentage, 4th/8th Grade NJASK Index, 11th Grade HSPA Index, School Completion Rate 2005-2009, School Budget per Pupil

NJASK and HSPA Indices
The New Jersey Assessment of Skills and Knowledge (NJASK) and High School Proficiency Assessment (HSPA) are operational assessments which consist of three content areas for Grades 4, 8, and 11: Language Arts Literacy, mathematics, and science. This assessment is given to indicate the progress students are making in the 3 content areas and as a requirement of the No Child Left Behind Act of 2001 (http://www.nj.gov/education/assessment/es/njask_tech_report11.pdf). The NJASK and HSPA indices show the performance of pupils on the three tests. In each case the mean average scores on each part of the test have been indexed with 1.000 representing a perfect score, and the indexes for the various parts of the test have been averaged (Legislative Data Book, 2010).

High School Completion Rate
Calculating the number of 2009 high school graduates by the estimated 2005 total ninth grade enrollment. Note: These may exceed 100 if more students graduated in 2009 than were enrolled in 2005.

NOTE: Data is missing for many municipalities for the NJASK, HSPA, Budget per Pupil, High School Completion Rate

D. Peer Behavior

Municipal-level data not available

E. Substance Abuse Related Problems

ER Admissions

Substance related ER Admissions were calculated using the Alcohol and Drug Associated Fraction (ADAF) (Harwood, et al., 1998). The ADAF was applied to the actual counts in order to derive the numbers in the tables. Rates are per 100,000.
F. Health Care Access

Municipal-level data not available

G. Substance Abuse Prevention Access

Municipal-level data not available

V. Demographic Profile
