**Summary:**

The table above details the identified asbestos-containing materials by homogeneous area (HA) at the proposed redevelopment site. The conditions of the samples range from good to damaged, with the most asbestos found in the electrical room of the 2nd floor. The majority of the asbestos is of the chrysotile type, with varying percentages. The materials are located in various parts of the site, including the top and lower levels of New Street, as well as the basement and first floor. Future investigations may involve the removal or mitigation of these asbestos materials to ensure safety for future occupants.
The materials listed in this table have been sampled and determined to contain asbestos in concentrations greater than 1%.
