WHY STUDY SNAKES?

Rare snakes often a regulatory issue for development, forestry, and vegetation and habitat management.

Many species rely on upland landscapes and these activities mostly occur in uplands.

Know little about most species because many are small and secretive and available funding is limited.

COMMISSION SNAKE RESEARCH

I. Joint Corn Snake Study (PCF)

II. Long-term Rare Snake Monitoring (NPS)

III. EPA Kingsnake Study (EPA)

IV. Snake Fungal Disease (NPS)

V. Snake Genetics (PCF)
I. JOINT CORN SNAKE STUDY

Collaboration between HA, TCNJ, ENSP, and PC

Four Components

1. Radio telemetry
2. Headstarting
3. Drift fence array
4. Critical habitats
I. JOINT CORN SNAKE STUDY

1. Radio telemetry

Capture snakes

Surgically implant radio transmitters
I. JOINT CORN SNAKE STUDY

1. Radio telemetry

Located snakes 2–3x per week in 2017–2019

- Environmental, habitat, and behavioral data
- Activity range and habitats used
- Timing of nesting, shedding, and denning
- Location of dens, nests, and shed sites
- Before and after prescribed burning
I. JOINT CORN SNAKE STUDY

2. Headstarted vs cold released hatchlings

Collected eggs from nest areas and hatched in the laboratory

Cold release group released back to nest area

Headstarted group kept over winter and fed
I. JOINT CORN SNAKE STUDY

2. Headstarted vs cold released hatchlings

Performed lab experiments on headstarted hatchlings

Substrate, cover, temperature preferences

Headstarting was done 2017 – 2020

Goal is to compare survivorship of the two groups

Recaptured 6 headstarted and 5 cold released so far

Need to find more of both groups
I. JOINT CORN SNAKE STUDY

3. Drift Fence trapping and cover study

Drift fences: 800 ft, 1800 ft, 255x255 ft, 150x225 ft
83 box traps, 83 plywood, 83 metal

Spring – Fall of 2019 – 2022

Goal: capture hatchlings and assess survey methods
I. JOINT CORN SNAKE STUDY

3. Drift Fence trapping and cover study

Box trap
I. JOINT CORN SNAKE STUDY

3. Drift Fence trapping and cover study

4,046 animals
## 3. Drift Fence trapping and cover study

I. JOINT CORN SNAKE STUDY

3. Drift Fence trapping and cover study

Fence successfully captured large and small snakes

Tracked four corn snakes around the fence

The tracked corn snakes climbed over the fence

Moved them back and climbed over the fence again
I. JOINT CORN SNAKE STUDY

4. Locating dens, nests, and shed areas

2017 – 2020

Critical habitats

Maintain some fidelity

Critical habitats are often communal

Camera monitoring network
II. LONG-TERM RARE SNAKE MONITORING

Little data exists on rare snake trends in the Pinelands

54 corn snake dens (50 are corralled)

27 kingsnake dens (13 corralled)

10 pine snake dens (8 corralled)

Add more pine snake dens and find hognose snake dens

Corral is non-invasive method to census snakes

No physical disturbance to dens or hibernating snakes
III. KINGSNAKE STUDY

Listed as SC for threats, declines, and unknown status

2019 tracked 13 snakes to prepare for a study

2020 PC, HA, and TCNJ started study

Radio tracked 30 snakes total so far

6 killed, one died mysteriously, one went missing

Roughly equal # of males and females

Activity range and habitat use

Timing of denning and nesting
Emerging fungal disease found in snakes

Caused by *Ophidiomyces ophiodiicola* (Oo)

Rutgers and HA has been excavating dens for 35+ years

Collaboration between Rutgers, HA, USGS, and PC

Opportunity to sample for Oo inside dens

Pilot sampling in 2018 and all snakes in 2019

Oo only in den soils and not in soil with other microbes

Manuscript being submitted for publication
V. CORN SNAKE & KINGSNAKE GENETICS

Collaboration between Arcadia, TCNJ, ENSP, and PC

Natural extension of the current research

Sampling snakes from our studies and other snakes

Genetic diversity of each species

Potential impact of barriers such as roads

NJDEP recent focus on habitat connectivity

NJDEP Connecting Habitat Across NJ (CHANJ)
